
SOMERSET COUNTY

Wastewater Management Plan

Wastewater Capacity Analyses and Strategies for Addressing Potential Capacity Deficiencies Component

**Amending the Northeast, Upper Raritan and Lower Raritan-Middlesex County
Areawide Water Quality Management Plans**

WMP Agency: Somerset County Planning Board

**Submitted by the Somerset County Board of Commissioners in collaboration with Somerset
County's Municipalities**

Date of Submittal: April 8, 2021

Date Adopted by the New Jersey Department of Environmental Protection:

Prepared By:
The Somerset County Planning Division
In Collaboration with Somerset County Municipalities, Sewer Authorities and Utilities
Serving Somerset County, and Maser Consulting

I. SUMMARY OF ACTIONS

A. Background

In January 2014, P.L. 2011, c. 203 was amended, supplemented and enacted as P.L. 2013, c. 188 (hereafter P.L. 2013, c.188), modifying the water quality management planning process. P.L. 2013, c.188 was to expire on January 17, 2016, or upon the reauthorization and adoption of Water Quality Management Planning rules, N.J.A.C. 7:15 et seq.), whichever was to come first. Similar to the P.L. 2011, c. 203, Section 9 of P.L. 2013, P.L. c., 188 provided that upon adoption of the designation of a sewer service area pursuant to the Water Quality Management Planning rules, portions of the wastewater management plan (WMP), now referred to as “WMP components”, may be submitted for review and subsequent adoption, in phases in a sequential or other manner deemed timely or expedient by NJDEP.

This document is comprised of Wastewater Management Plan (WMP) components for Somerset County, pursuant to the current Water Quality Management Planning rules, adopted October 6, 2016 and published in the New Jersey Register on November 7, 2016. This component, entitled, “*Wastewater Capacity Analyses and Strategies for Addressing Potential Capacity Deficiencies*” includes:

- **Wastewater Treatment Facility Capacity Analysis:** The wastewater treatment facility (WWTF) capacity analysis for WWTFs located in Somerset County is provided in Section III, excluding the capacity analysis for WWTFs located in Montgomery Township, which is contained in the Montgomery Township-Rocky Hill Borough Component adopted November 4, 2019.
- **Nitrate Dilution-Based Septic Capacity Analysis:** The nitrate dilution and septic capacity analysis applicable to non-sewer service areas throughout Somerset County is presented in Section IV below.
- **Strategies for Addressing Capacity Deficiencies:** Strategies for mitigating potential WWTF capacity deficiencies in assigned sewer service areas and potential septic capacity deficits in non-sewer service areas are provided in Section V, except that solutions to WWTF capacity deficits affecting Montgomery Township and Rocky Hill are included in the Montgomery Township-Rocky Hill Borough Component adopted November 4, 2019.

The GIS datasets that were used in the above analyses underwent a comprehensive update by the County Planning Division that was completed in 2019. The County hired Maser Consulting in 2019 to utilize these datasets together with NJDEP’s WMP Model Builder Tool to perform the wastewater capacity analyses, the results of which were verified by the County’s municipalities during the summer of 2020. These results were refined based on municipal feedback during the fall of 2020 and incorporated into the Somerset County “Wastewater Capacity Analyses and Strategies for Addressing Capacity Deficiencies Component”. Upon adoption by NJDEP, it will be incorporated into the Northeast, Upper Raritan and Lower Raritan/Middlesex County Water Quality Management Plans (WQMPs) via the areawide WQMP amendment procedure at N.J.A.C. 7:15-3.

This component does not supersede the WWTF capacity analysis and strategies for addressing WWTF capacity deficits contained in the Montgomery Township and Rocky Hill Borough Component of the Somerset County Wastewater Management Plan adopted by NJDEP on November 4, 2019. However, the Nitrate Dilution-based Septic capacity Analysis portion of this WMP Component supplements the Montgomery Township and Rocky Hill Borough Component.

The following previously adopted WMPs have been replaced (superseded) in whole or in part by this Somerset County WMP Component:

- Somerset County Upper Raritan Wastewater Management Plan, 1999
- Bernards Township Wastewater Management Plan, 2000
- Warren Township Wastewater Management Plan, 2007

This component, together with the following components represents the entire complete Wastewater Management Plan for Somerset County: “*Somerset County WMP, Mapping and Wastewater Service Area Component*” submitted for adoption by NJDEP on February 24, 2021, “*Montgomery Township-Rocky Hill Borough WMP Component*” adopted by NJDEP on November 4, 2019, and the “*Somerset County Septic Management Plan*”, submitted for adoption to the NJDEP on February 7, 2020, portions of which were refined and resubmitted to NJDEP on September 16, 2020 and February 9, 2021.

B. Summary of Actions – Potential Capacity Deficiencies

According to the Montgomery Township and Rocky Hill WMP Component, future capacity deficiencies are likely to occur at the Pike Brook and Stage II WWTFs located in Montgomery Township for which capacity expansions are planned and/or underway as described in the Montgomery Township - Rocky Hill Borough WMP Component.

In addition, future capacity deficiencies will likely occur at the below-listed WWTFs discharging to surface water based on the WWTF Capacity Analysis performed for Somerset County by Maser Consulting (see Appendices A and C). Strategies for addressing potential future capacity deficits at these facilities are described in Section V.

- Harrison Brook STP in Bernards Township
- Somerset Raritan Valley SA in Bridgewater Township
- Warren Stage I & II in Warren Township
- Warren Stage V in Warren Township

The nitrate dilution-based septic capacity analysis performed for the non-sewer service areas in Somerset County shows there is only one HUC11 watershed within which the nitrate dilution standard could potentially be exceeded under full-buildout conditions based on current zoning, which is the Passaic River UPr (above Pine Bk br) in Bernards Township. Solutions for addressing this potential capacity constraint are described in Section V below.

II. WWTF CAPACITY ANALYSIS, NITRATE DILUTION-BASED SEPTIC CAPACITY ANALYSIS AND STRATEGIES FOR ADDRESSING CAPACITY DEFICIENCIES

A. Purpose

The purpose of this initiative is to provide a comprehensive, updated WMP for the County of Somerset, pursuant to the Water Quality Management Planning Rules that were adopted on October 6, 2016 and published in the New Jersey Register on November 7, 2016. The Somerset County Wastewater Management Plan and all components thereof are intended to support local and county land use, infrastructure and preservation planning, policy and investment decisions. Furthermore, the provision of appropriate wastewater management services both now and in the future is fundamental to ensuring sustainable communities, economic prosperity, public health and safety and environmental resource protection.

The wastewater treatment facility and septic capacity analyses and associated strategies for addressing potential capacity deficits that comprise this WMP component are important for understanding existing and future demand for wastewater treatment services, and ensuring adequate capacity is available in existing communities and locations where future development is anticipated based on local land use plans and policies.

B. Water Quality Management Planning Framework

Areas within Somerset County are included in the following Water Quality Management Planning (WQMP) Areas: 1) Upper Raritan Areawide WQMP Area, 2) Northeast WQMP Area and 3) the Lower Raritan/Middlesex County WQMP Area. As noted in N.J.S.A. 7:15-2.3, "Areawide Water Quality Management Plans (WQMP) identify and address selected water quality and wastewater management issues for a particular jurisdictional area, including strategies to address both point and nonpoint source pollution. The areawide WQMP is the basis by which the NJDEP and the designated planning agencies (DPAs) conduct selected water quality management planning activities for a particular area of the State. The aforementioned WQMP areas represent three (3) of the twelve (12) areawide WQMPs, which together cover the entire State of New Jersey that were established pursuant to Sections 208 and 303 of the Clean Water Act. Areawide WQMPs include the WMPs, TMDLs, and other water quality improvement and wastewater related plans as determined appropriate by the DPA and the NJDEP". The "Somerset County WMP Wastewater Capacity Analysis and Strategies for Addressing Potential Capacity Deficiencies", together with the other components identified above comprise the Somerset County Wastewater Management Plan (WMP). The Somerset County WMP constitutes a portion of the Upper Raritan Water Quality Management Plan, Northeast Water Quality Management Plan and the Lower Raritan/Middlesex County Water Quality Management Plan, which have been effectuated through the areawide wastewater management planning process described in N.J.A.C. 7:15-4.

1. Designated Planning Agency

The NJDEP serves as the Designated Planning Agency (DPA) for the Upper Raritan and Northeast WQM Planning Areas of which Somerset County is a part. The Middlesex County Board of Commissioners is the DPA for the Lower Raritan/Middlesex County WQM Planning Area of which Somerset County is also a part.

2. Wastewater Management Planning Agency

The Somerset County Planning Division was appointed by the Somerset County Board of Chosen Freeholders (now referred to as Board of Commissioners) to act as the designated wastewater management planning agency (WMPA) for Somerset County in 2008 and is charged with WMP preparation and maintenance. As of the date of submittal, wastewater management planning responsibility for the entire County remains with the Somerset County Board of Commissioners and no alternative assignments have occurred pursuant to N.J.A.C. 7:15-2.8. All Somerset County municipalities are addressed in the Countywide WMP.

Any proposed revisions or amendments to the Somerset County WMP and any component thereof shall be submitted to the Somerset County Planning Board, Somerset County Administration Building, P.O. Box 3000, Somerville, NJ 08876, e-mail: PlanningBd@co.somerset.nj.us; the affected municipalities, affected sewer authorities and the NJDEP in accordance with N.J.A.C. 7:15-3.4 and 3.5 and the Somerset County Planning Board's procedures found at the following link: <https://www.co.somerset.nj.us/government/public-works/planning/wastewater-plan/wqmp-revision-and-amendment-procedures>. If the subject site is located in the Lower Raritan-Middlesex County WQM Plan Area, a copy of the application must also be submitted to the Middlesex County Office of Planning, Middlesex County Administration Building, 75 Bayard St., New Brunswick, NJ 08901, e-mail: Douglas.Greenfeld@co.middlesex.nj.us.

C. Wastewater Management Planning Process

The County has addressed all requirements of the WQMP Rules at N.J.A.C. 7:15-3.5(f) concerning coordination with and solicitation of comments or consent from various stakeholders and agencies to ensure consistency with other plans as described below.

1. Municipal Involvement

The information contained in this WMP Component was reviewed by municipal WMP committees, local elected officials, sewerage utilities and authorities serving areas within the County and other stakeholders during 2020. Municipalities have also been given the opportunity to consent to this "Somerset County WMP Wastewater Analysis and Strategies for Addressing Potential Capacity Deficiencies Component".

Municipal wastewater management planning (WMP) committees are appointed annually by the mayors of each municipality to work with the County Planning Division and NJDEP in developing and implementing the countywide wastewater management planning process. They were instrumental in reviewing the draft results of the wastewater capacity analyses performed by Maser Consulting and provided project- and site-specific information that was used to improve the accuracy of the results. These committees include but are not limited to representatives from municipal sewer utilities or authorities, municipal elected officials, engineers and planners. A significant portion of the data and information upon which this WMP Component is based was provided and/or verified by the municipal WMP committees. All GIS data used in preparing the WWTF build-out and capacity analyses and WMP maps

that were originated by the County Planning Division were also submitted to municipal WMP committees for review and verification. The text, tables and appendices associated with this WMP Component have also been provided to municipal WMP committees for review and comment. Changes were made based on municipal and stakeholder feedback prior to submission to the NJDEP for adoption.

Updates on the status of the County's wastewater management planning process have been provided at all regularly scheduled meetings of the County Planning Board and at the Planning Partners Forums held quarterly for local elected officials, municipal planners and municipal WMP committee representatives by the County Planning Board on an ongoing basis. Information about the WMP process and draft and final components of the plan are posted on the County Planning Board's Wastewater Management Planning Webpage: <https://www.co.somerset.nj.us/government/public-works/planning/wastewater-plan>. The County Planning Division communicates on a regular basis via direct e-mail and other venues with members of municipal WMP committees regarding WMP development activities.

2. Stakeholder Involvement

Regional WWTF operators/managers from sewer authorities that serve areas within Somerset County also participated in the development of this WMP Component and were provided with the wastewater capacity analyses and text in during 2020 and early 2021 for their review and comment. This information was also provided to adjoining counties, the NJ Water Supply Authority, the NJ Highlands Council and NJDEP before finalization. The Middlesex County Planning Board which represents the County Board of Commissioners and serves as the Designated Planning Agency (DPA) for the Middlesex County-Lower Raritan WQMP Area together with the Middlesex County Water Resource played a major role in the review and adoption of this WMP Component.

The NJ Office for Planning Advocacy have also participated in the process and been given the opportunity to review, comment upon and consent to this WMP component as well as all other Somerset County WMP components that have been submitted previously to NJDEP for adoption.

County staff also works closely with the WMP Group in NJDEP on an ongoing basis. Quarterly WMP meetings, periodic phone calls and e-mail communications involving NJDEP's WMP Group and County staff took place throughout the course of developing all components of the Somerset County WMP. For example, the NJDEP WMP Group reviewed and commented upon the draft methodology for conducting the analyses contained in this component of Somerset County's WMP, before it was finalized and used by Maser Consulting to perform the WWTF and septic capacity analyses. Copies of all stakeholder correspondence and information pertaining to the development of this WMP component were provided to the NJDEP WMP group. The process for identifying solutions to potential capacity deficits in collaboration with sewerage agencies, municipalities and NJDEP was also developed in consultation with the NJDEP WMP Group.

Meetings with county staff involved in the WMP process from throughout the state, together with NJDEP WMP supervisory staff have been hosted by the NJ County Planning Association on a periodic basis. The purpose of these ongoing efforts is to improve coordination and collaboration regarding WMP development and implementation. The information and insights obtained through these meetings was used to advance the completion of this WMP component.

During the rule-making process leading up to the adoption of the 2016 WQMP Rules and for a few years thereafter, the NJDEP hosted information meetings for County staff engaged in the WMP process statewide, all of which were attended by members of the Somerset County Planning Division. Formal written comments were submitted by the County Planning Board concerning the proposed rules during the public comment period associated with the 2016 Rules. This involvement strengthened County Planning staff's knowledge of the WQMP Rules and requirements for completing the County WMP. The County Planning Board and its staff will continue to engage in future related rulemaking processes.

III. WASTEWATER TREATMENT FACILITY CAPACITY ANALYSIS

A. Overview of Methodology

The purpose of this analysis is to determine if there is sufficient domestic wastewater treatment capacity to meet the needs of the County based on future new flow estimates. This requires the aggregation of future wastewater flows associated with projected population for urban municipalities with build-out based future wastewater flows for non-urban municipalities. Future flows by domestic WWTF are added to the estimate of existing flows and this sum is compared to permitted flows in accordance with the Wastewater Treatment Capacity Analysis requirements in N.J.A.C. 7:15-4.5 for those WWTFs that are located within Somerset County. The results of this analysis for WWTFs located in Montgomery are included in the Montgomery Township-Rocky Hill Borough WMP Component Adopted November 4, 2019. The results for all other domestic WWTFs serving Somerset County are provided below. See Appendices A and F for the detailed methodology used to prepare the WWTF Capacity Analysis by Maser Consulting for Somerset County.

Domestic treatment works are defined as publically-owned treatment works as well as any other treatment works processing primarily domestic sewage and pollutants together with any ground water, surface water, or process wastewater that may be present in N.J.A.C. 7:15-1.5. They include NJPDES Permit Category A - domestic treatment works that discharge to surface water and NJPDES Permit Category B - industrial wastewater facilities that receive wastewater from outside the industrial facility boundaries are subject to the Wastewater Treatment Capacity Analysis requirements in N.J.A.C. 7:15-4.5. None of the industrial wastewater facilities in Somerset County receive wastewater from outside their facility.

B. Existing Wastewater Flows

Existing wastewater flows have been estimated for each domestic wastewater treatment facility discharging to surface water located within Somerset County (excluding those addressed in the Montgomery Township-Rocky Hill Borough WMP Component) using the highest consecutive 12-month rolling average for the five (5) year period between January 1, 2015 and March 1, 2020, as reported in the Discharge Monitoring Reports

required pursuant to N.J.A.C. 7:14A-6.8. This information is presented in Table III.B.1, which also compares existing and permitted flows for each WWTF.

In accordance with N.J.S.A. 7:15-4.5 (b)5., “For existing permitted wastewater treatment facilities, where the existing flow is 80% or more of the permitted flow at the time of WMP development, the wastewater management planning agency shall coordinate with the NJDEP and the entity responsible for the applicable wastewater treatment facility to determine if remaining projected growth will result in a capacity deficiency and, if the potential capacity deficiency exists, to analyze effective strategies to address this potential deficiency”. As shown below, existing flows as a percentage of permitted flows exceeds 80% for the Harrison Brook, SRVSA, Warren Stage I & II and Warren Stage IV WWTFs. Existing flows for the Bernardsville Sewage Treatment Plant (STP) is 79.75% of permitted flows.

The Wastewater Treatment Facility Capacity Analysis results for these facilities are presented in Table III.C.3. The results show that total existing plus future flow comes very close to permitted flow capacity at full build-out for the Harrison Brook WWTF, and exceeds permitted capacity at the SRVSA, Warren Stage I & II and Warren Stage IV WWTFs. Strategies that address potential capacity deficiencies for the affected WWTFs are included in Section II.F below.

TABLE III.B.1: SUMMARY OF PERMITTED AND EXISTING FLOWS FOR DOMESTIC WWTFs LOCATED WITHIN SOMERSET COUNTY				
FACILITY NAME & MUNICIPALITY	NJPDES PERMIT NO.	PERMITTED FLOWS (MGD)	ESTIMATED EXISTING FLOWS	PCT. OF PERMITTED FLOWS
Fiddlers Elbow Country Club, Bedminster	NJ0021865	0.03	0.010	34.72
NJAW EDC (formerly Environmental Disposal Corporation), Bedminster	NJ0033995	2.1	1.290	61.43
Harrison Brook, Bernards	NJ0022845	2.5	2.208	88.32
Veterans Affairs Health Care System – Lyons, Bernards	NJ0021083	0.4	0.177	44.19
Bernardsville STP, Bernardsville	NJ0026387	0.8	0.638	79.75

Somerset Raritan Valley Sewerage Authority (SRVSA), Bridgewater	NJ0024864	24.31	25.265	103.93
Warren Stage I & II, Warren	NJ0050369	0.47	0.467	99.36
Warren Stage IV, Warren	NJ0022497	0.8	0.770	96.25
Warren Stage V, Warren	NJ0022489	0.38	0.202	53.16

Notes: 1. Estimated existing (current) flow is represented by the greatest 12-month rolling average to occur during the five year period between January 1, 2015 and March 1, 2020.

2. This table excludes information for WWTFs that are not located within Somerset County as follows: MCUA (NJ0020141), Stony Brook (NJ0031119) and Berkeley Heights (NJ0027961). The WWTF Capacity Analyses for these facilities are addressed in the Middlesex County, Mercer County and Berkeley Heights, Union County Wastewater Management Plans respectively. The Fiddlers Elbow and Veterans Affairs Health Care System facilities do not serve the public. This table excludes data for WWTFs located in Montgomery Township.

C. Future Wastewater Flows

1. Wastewater Demand Projections in Urbanized Municipalities

The WQMP Rule (N.J.A.C. 7:15-1.15) defines urbanized municipalities as those municipalities where 90 percent of the municipality’s total land area appears as “Urban” as designated in NJDEP’s most recent GIS Land Use/Land Cover dataset. Urbanized municipalities also include those municipalities identified as “Urban Aid” pursuant to the New Jersey Redevelopment Act, N.J.S.A. § 55:19-20 et seq.; as an “Urban Enterprise Zone” pursuant to the New Jersey Urban Enterprise Zones Act, N.J.S.A. 52:27H-60 et seq.; as a “Garden State Growth Zone” municipality pursuant to the New Jersey Economic Opportunity Act of 2013, N.J.S.A. 52:27D-489p et seq.; and as Transit Villages approved by the New Jersey Department of Transportation and NJ Transit. Based on this definition, three Somerset County municipalities are considered to be “urban” for which the determination of future wastewater flows was made in accordance with N.J.A.C. 7:15-4.5(b)1ii(1). They are Bound Brook Borough, North Plainfield Borough and Somerville Borough. Future growth in these municipalities will occur primarily through redevelopment. A 20-Year Projection (using a planning horizon year of 2040) of Future Wastewater Flows based on population and employment growth was prepared for these municipalities as described in Chapter II.A. “Wastewater Demand Projections in Urbanized Municipalities” in the “Wastewater Treatment Facility & Septic Buildout and Capacity Analysis” included (Appendix A), the results of which are summarized in Table III.C.1 below:

TABLE III.C.1: PROJECTED WASTEWATER FLOWS (MGD) FOR URBAN MUNICIPALITIES				
Urban Municipalities	Projected Flows from Population Increase (2020 – 2040)	Projected Flows from Non-Residential Development	Future Added Wastewater Flows	Receiving WWTF
Bound Brook	0.05445	0.001505	0.055955	MCUA (NJ0020141)

Borough				
North Plainfield Borough	0.08205	0.0004	0.08245	MCUA (NJ0020141)
Somerville Borough	0.156975	0.0170195	0.1739945	SRVSA (NJ0247561)

2. Buildout-Based Wastewater Demand in Non-urban Municipalities

The majority of Somerset County's municipalities are considered to be "non-urban" in accordance with N.J.A. C. 7:15-4.5(b)1ii(2). Table III.C.2 summarizes information on potential future added wastewater flows for each domestic WWTF serving Somerset County by contributing source (excluding WWTFs serving Montgomery Township and Rocky Hill). There are no industrial WWTFs in Somerset County that receive wastewater from outside the facility's property boundaries.

Future added wastewater flow is calculated based on the type of development (ex. Residential dwelling, commercial facility) that can potentially occur within each Assigned Sewer Service Area, and the amount of wastewater estimated to be generated by future development as provided in N.J.A.C. 7:14A-23.3. GIS-based build-out analysis results derived from vacant potentially developable land to which municipal-specific zoning density and use factors was applied, coupled with GIS-based contributing source data were then converted to projected future wastewater flow by applying the planning flow criteria from N.J.A.C. 7:14A based on development type. Future residential development is assumed to consist of homes with an average of 3 bedrooms each. The number of future residential units was multiplied by 300 gallons per day to estimate future residential wastewater generated. For non-residential land uses, future floor area was multiplied by 0.1 gallon per day to estimate future non-residential wastewater generation. For details on the methodology used and analysis results, see Chapter II.B. "Wastewater Demand Projections in Non-urbanized Municipalities" the "Wastewater Treatment Facility & Septic Buildout and Capacity Analysis" report prepared by Maser Consulting for Somerset County (Appendix A). The GIS Zoning, Potentially Developable Vacant Land, and other contributing source datasets used in this analysis were developed and are maintained by the Somerset County Planning Division in collaboration with each Municipal Wastewater Management Committee. Parcel- and project-based results by municipality and WWTF are presented Appendix B.

*Notes: *includes flows for both future Non-Res. and Mixed-Use development types. This table excludes data for WWTFs located in Montgomery Township.*

3. Future Flows to WWTFs Located Outside Somerset County

Portions of Somerset County are served by WWTFs that are located outside of the County. Future (projected) wastewater flow Information for these WWTFs is included in the following table. The County Planning Division has provided its calculated future/projected flow results for these facilities to the respective county WMP entities within which these facilities are located by sharing this document. Somerset County supports collaboration and coordination of among its neighboring Wastewater Management Planning Agencies to ensure completion of all countywide WMPs that affect Somerset County and their timely adoption by the affected Designated Planning Agencies and NJDEP.

TABLE III.C.3: SUMMARY OF WASTEWATER FLOWS (MGD) FROM ASSIGNED SSA WITHIN SOMERSET COUNTY TO DOMESTIC WWTF LOCATED OUTSIDE OF SOMERSET COUNTY					
WWTF NAME & LOCATION	NJPDES PERMIT NO.	EXISTING FLOW	FUTURE (Added) FLOW (MGD)	FUTURE FLOW (Existing + Added) SUBTOTAL	NAME OF RESPONSIBLE WMP ENTITY
Middlesex County Utility Authority, Sayreville, County of Middlesex	NJ0020141	119.247	1.379	120.626	Middlesex County Planning Board
Stony Brook Regional S.A, Princeton Twp., County of Mercer	NJ0031119	11.654	0.001	11.655	Mercer County Planning Board
Berkeley Heights Water Pollution Control Plant, Berkeley Heights, County of Union	NJ0027961	1.640	0.176	1.816	Berkeley Heights, and Union County Planning Boards

Notes: Future added flows from SSAs located outside of Somerset County that are assigned to these facilities are not included in this table. This data and the full capacity analyses for these WWTFs are available in the draft and/or adopted Countywide Wastewater Management Plans for The Counties of Middlesex and Mercer.

D. WWTFs Located in Somerset County with Potential Capacity Deficits

A WWTF capacity analysis was performed for WWTFs located in Somerset County that serve the public. The analysis takes into account existing and potential future wastewater flows associated with both urban and non-urban municipalities and enables an assessment of whether there is sufficient wastewater treatment capacity to meet the future needs of each facility’s assigned sewer service area. This analysis involves a comparison of the existing plus potential future wastewater flows to the current permitted wastewater flows for each WWTF. “Any deficit between the need and the permitted flow constitutes a potential capacity deficiency” according to N.J.A.C. 7:15-4.5(b)3.i. For more information about the capacity analysis for Somerset County, see Chapter II.C of the “Wastewater Treatment Facility and Septic Buildout and Capacity Analysis” Report” (Appendix A) and the tables comprising Appendix C. The results of this analysis are summarized in Table III.C.3. Potential capacity deficits have been identified for four (4) WWTFs located in Somerset County: Harrison Brook, SRVSA, Warren Stage I & II and Warren Stage IV when the NJDEP Capacity Assurance Program threshold of 95% is applied as a conservative measure. Section V below presents strategies for mitigating potential capacity deficiencies at these facilities. All other WWTFs located in Somerset County and identified in this table are capable of treating their respective assigned sewer service area’s current and total future wastewater flows.

Table III.D.1: SUMMARY OF WASTEWATER FLOWS (MGD) FROM ASSIGNED SSA WITHIN SOMERSET COUNTY TO DOMESTIC WWTF LOCATED WITHIN SOMERSET COUNTY

FACILITY NAME	NJPDES PERMIT NO.	EXISTING (Current) FLOW (MGD)	FUTURE (Added) FLOW (MGD)	TOTAL FUTURE FLOW (Current + Added) (MGD)	PERMITTED FLOW (MGD)	SURPLUS or *DEFICIENCY (MGD)	PCT CAPACITY
Fiddlers’ Elbow Country Club	NJ0021865	0.010	0	0.10	0.03	.02	34.72%

Warren Stage IV, Warren	NJ0022497	0.770	0.211	0.981	0.8	*0.181	122.65%
Warren Stage V, Warren	NJ0022489	0.202	0.015	0.217	0.38	0.163	57.12%

*Notes: Data for WWTFs located in Montgomery Township is included in the Montgomery Township-Rocky Hill Borough WMP Component. *Capacity solutions including but not limited to WWTF expansions will be needed to accommodate future wastewater influent levels. . This table excludes data for WWTFs located in Montgomery Township.*

E. Wastewater Treatment Facility Information Tables

Facility information tables are provided for existing and proposed WWTFs located within Somerset County (except for those located in Montgomery Township, since they are provided in the Montgomery Township - Rocky Hill Borough Component adopted by NJDEP on November 4, 2019). Facility tables include the permit number, receiving water, location, population served, and current and future flows for each WWTF. Facility tables are not provided for WWTFs that serve areas within the County but are located outside of the County.

Facility tables are specific to and grouped by NJPDES permit category type as follows:

- individual permits for discharges of sanitary and/or process wastewater to surface water bodies including **NJPDES Category A** permits for domestic treatment facilities and **NJPDES Category B** permits for industrial treatment facilities;
- individual **NJPDES Category GW** permits for sanitary and industrial wastewater facilities discharging to groundwater at greater than 2,000 GPD pursuant to N.J.A.C. 7:14A; and
- General **NJPDES Category T1** permits for discharge of sanitary sewerage from facilities to a subsurface disposal (septic) system with a design volume exceeding 2,000 GPD in accordance with N.J.A.C. 7:9A-1 et seq.

Please note that there are no consolidated school permits (NJPDES Category ASC Permits) in Somerset County at the current time.

**Table III.E.1
Fiddler's Elbow Country Club**

Permit Category A

(To Remain in Operation)

1. Existing facility:	Fiddler's Elbow Country Club	
2. New Jersey Pollutant Discharge Elimination System Permit Number:	NJ0021865	
3. Discharge to surface water (DSW) or ground water (DGW):	DSW	
4. Receiving water or aquifer:	Lamington River	
5. Classification of receiving water or aquifer:	FW2-NT(C2)	
6. Owner of facility:	Lamington River Farms	
7. Operator of facility:	Thomas Hurley LAMINGTON RIVER FARMS PO BOX 248 Far Hills, NJ 07931 Phone: 908 439-2123 Email: thurley@fiddlerselbowcc.com	
8. Co-Permittee of facility (<i>where applicable</i>):	Not applicable	
9. Location of facility:		
a. Municipality & County	Bedminster Township, County of Somerset	
b. Street Address	811 Rattlesnake Bridge Rd., Bedminster, NJ 07921	
c. Block(s) and Lot(s)	Block 37.01; Lot 1.01	
10. Location of discharge (in State Plane Coordinates):	X Coord: 430670, Y Coord: 658133	
11. Present permitted flow or permit condition (DSW) or daily maximum (DGW):	0.03 MGD	
12. Summary of population served/to be served including major seasonal fluctuations:	**Current (Year 2017) Population	**Build-out Population
Fiddlers Elbow, Bedminster:	325 people per day	325 people per day
13. Summary of wastewater flow received/to be received as a 30-day average flow for DSW:	*Current Flow (MGD)	Build-out Flow (MGD)
Fiddlers Elbow, Bedminster:	0.010	0.03
Facility Total	0.010	0.03
Notes: *Total current/existing wastewater flow is based on the maximum 12-month rolling average for the period of Jan. 1, 2019 – Jan. 31, 2019 within the five (5) year period of January 2015 – March 2020 as reported monthly by Fiddlers Elbow in the DMR reports filed with NJDEP. **Current and future population for the Fiddlers Elbow WWTF is based on information provided by Matthew Willigan, Course Superintendent on behalf of Lamington River Farms, PO Box 248, Far Hills, NJ 07931. This facility is comprised of five (5) residential cottages, tennis pro-shop, swimming pool and tennis courts, golf academy, pro-shop, indoor and outdoor kitchen and dining facilities, clubhouse, cart barn and golf courses. An expansion of the golf club facilities is not known to be proposed at this time.		

Table III.E.2 NJ American Water Co. (Formerly Environmental Disposal Corp.) Permit Category A (To Remain in Operation)		
1. Existing facility:	NJ American Water	
2. New Jersey Pollutant Discharge Elimination System Permit Number:	NJ0033995	
3. Discharge to surface water (DSW) or ground water (DGW):	DSW	
4. Receiving water or aquifer:	Raritan River via tributary	
5. Classification of receiving water or aquifer:	FW2-NT(C2)	
6. Owner of facility:	NJ American Water (NJAW)	
7. Operator of facility:	MANOJ b. Patel, Ops. Manager ENVIRONMENTAL DISPOSAL CORP 601 Route 202-206 Bedminster, NJ 07921 Phone: 732 302-3177 Email: mike.roberti@amwater.com	
8. Co-Permittee of facility (<i>where applicable</i>):	Not applicable	
9. Location of facility:		
a. Municipality & County	Bedminster Township, County of Somerset	
b. Street Address	601 State Hwy. 202/206 Bedminster, NJ 07921	
c. Block(s) and Lot(s)	Block 59.28; Lot 1	
10. Location of discharge (in State Plane Coordinates):	X Coord: 452185, Y Coord: 663719	
11. Present permitted flow or permit condition (DSW) or daily maximum (DGW):	2.1 MGD	
12. Summary of population served/to be served including major seasonal fluctuations:	Current (Year 2018) Population	**Build-out Population
Bedminster:	6,201	6,272
Bernards:	5,683	5,686
Far Hills:	467	593
Peapack & Gladstone:	2,082	2,544
Total Population Served:	14,433	
13. Summary of wastewater flow received/to be received as a 30-day average flow for DSW:	*Current Flow (MGD)	***Build-out Flow (MGD)
Bedminster:	0.554	0.589
Bernards:	0.508	0.508
Far Hills:	0.042	0.057
Peapack & Gladstone:	0.186	0.238
Facility Total	1.290	1.392
Notes: * Total current/existing wastewater flow is based on the maximum 12-month rolling average for the period of February 2018 – January 2019 within the five (5) year period of January 2015 – March 2020 as reported monthly by NJWA EDC WWTP in the DMR reports filed with NJDEP, which is distributed to the municipal level based on Current Population.		

** Build-out population was estimated by multiplying the number of DUs calculated in the build-out analysis by the 2018 average household size for each municipality based on U.S. Census Bureau, American Community Survey Data and adding the result to the current year (2018) population.

***Build-out flow was developed on a project and tax parcel basis as detailed in Appendices A and B. The NJAWC WWTF serves individual and commercial users in its Franchise Area, which coincides with “The Hills” Development area in Bedminster and Bernards Township. It also serves users in the villages of Bedminster and Pluckemin located in Bedminster Township and the downtown areas of the Boroughs of Far Hills and Peapack and Gladstone via three (3) Bulk User Contracts.

Somerville:	2.391	2.565
Warren:	1.317	1.428
Facility Total	25.265	29.159

Notes: * Total current/existing wastewater flow for the SRVSA WWTF is based on the maximum 12-month rolling average for the period of August 2018 – July 2019 within the five (5) year period of January 2015 – March 2020 as reported monthly by SRVSA in the DMR reports filed with NJDEP. Total existing flow was then allocated proportionally to the municipalities based on current population derived from the U.S. Census Bureau, 2018 American Community Survey (ACS), which was distributed to the wastewater service areas within each municipality via a GIS-based analysis.

** Build-out population was estimated by multiplying the number of DUs calculated in the build-out analysis by the 2018 average household size for each municipality based on ACS data and adding the result to the current year (2018) population.

*** Build-out flow was developed on a project and tax parcel basis as detailed in Appendices A and B. Urbanized municipality is shown in **bold**.

The discharge location of the SRVSA Treatment Plan was relocated from the Cuckels Brook, a tributary of the Raritan River classified as FW2-NT (C2) to the main stem of the Raritan River also classified as FW2-NT (C2) in early 2013. The previous discharge into the Cuckels Brook is no longer used except during extreme high flow conditions when the elevation of the Raritan River prevents full discharge of SRVSA's effluent to the Raritan River.

Facility Total	25.265	29.159

Notes: * Total current/existing wastewater flow for the SRVSA WWTF is based on the maximum 12-month rolling average for the period of August 2018 – July 2019 within the five (5) year period of January 2015 – March 2020 as reported monthly by SRVSA in the DMR reports filed with NJDEP. Total existing flow was then allocated proportionally to the municipalities based on current population derived from the U.S. Census Bureau, 2018 American Community Survey (ACS), which was distributed to the wastewater service areas within each municipality via a GIS-based analysis.

** Build-out population was estimated by multiplying the number of DUs calculated in the build-out analysis by the 2018 average household size for each municipality based on ACS data and adding the result to the current year (2018) population.

*** Build-out flow was developed on a project and tax parcel basis as detailed in Appendices A and B. Urbanized municipality is shown in **bold**.

This facility is intended for intermittent use during peak flow periods and will operate in tandem with SRVSA's primary WWTF located on Polhemus Lane, with which it shares an Assigned Sewer Service Area. It comprises a high-flow auxiliary wastewater treatment facility that is being constructed to alleviate sanitary sewer overflows occurring in Somerville Borough in the vicinity of the Somerville Sewer System connection with the SRVSA interceptor during high rainfall events. It is anticipated to discharge up to 5 days in duration per event up to 8 times per year. It is located on a 2.2-acre parcel (Block 300; Lot 13.03) acquired from the Somerset County Park Commission by SRVSA in 2019, which is situated within the Raritan River Greenway. This parcel has not been added to SRVSA's assigned sewer service area. This facility will also mitigate significant existing I & I issues within SRVSA's Assigned Sewer Service Area that are too costly and extensive to address through traditional I & I reduction methods and effectuates an increase in capacity at the main SRVSA WWTF located downstream on Polhemus Lane in Bridgewater. It will also protect nearby residential neighborhoods and public open space areas as well improve water quality conditions in and along the Peters Brook and the Raritan River. The facility is being developed in accordance with an administrative Consent Order between NJDEP, SRVSA and the Borough of Somerville that was executed on September 5, 2013. Associated with this project, a temporary relocated SSO was provided by the Borough of Somerville on a 12.9-acre Borough-owned open space parcel (Block 300; L 12). It is located next to the SRVSA yard comprised of Block 300; L 13.01 and will be discontinued when the Storm Control Treatment Facility becomes operational. Completion of the SCTF is anticipated in spring 2021.

11. Present permitted flow or permit condition (DSW):	0.025 MGD	
12. Summary of population served/to be served including major seasonal fluctuations:	Current (Year 2018) Population	Build-out Population
Hillsborough:	Not Available	Not Available
13. Summary of wastewater flow received/to be received as a 30-day average flow for DSW:	*Current Flow (MGD)	Build-out Flow (MGD)
Facility Total	0.0079	0.025

Notes/Sources: NJPDES PI Number 46471.

*According to the NJDEP Draft Permit Executive Summary included in the Surface Water Renewal Permit Action dated 11-17-16, this permit is to discharge an average of 0.012 MGD of treated industrial wastewater. "However, because a significant portion of the water is recycled back for reuse in its processes, the actual volume of effluent discharged is approximately 0.0079 MGD", which is described as "the facility's estimated long-term average flow."

This facility does not treat wastewater from off-site sources and therefore a capacity analysis was not performed as part of this WMP.

Table III.E.12 Hamilton Farm Permit Category GW Sanitary Subsurface Sewage Disposal System (To Remain in Operation)

Facility Total	0.005168	0.012

Notes/Sources: NJPDES PI Number 208022.

* WQMP Amendment Application Documentation -Adopted by NJDEP 12-12-2008 describes the treatment works as a constructed wetland treatment system and disposal via a drip disposal field to manage all wastewater produced by the buildings in the Farm Barn Area including the Farm Barn which has been converted to a visitor's center, 5 existing cottages, 2 exterior restrooms and 3 stand-alone trailhead low-flow compost toilets.

**Current/existing flow was derived from a query of the NJDEP DMR NJEMS database for the period of 08/01/15 – 08/01/20. The results provide a "Capacity" of 43.06%.

-----------------------	-----------------	----------------

Notes/Sources: NJPDES PI Number 214064.

According to the NJDEP Final Ground Water Renewal Permit Action dated 3/04/15, sanitary wastewater is treated by an on-site treatment plant and discharged to ground water via a 41,832 sq. ft. subsurface disposal bed. Sludge is removed from the storage tank on a periodic basis and managed at an approved residuals management site.

* Estimated (Est.) Current and Build-out homes and population was verified by Stacey Spangler, NJ American Water Co. 3/20/17.

**Current/existing flow was derived from a query of the NJDEP DMR NJEMS database for the period of 08/01/15 – 08/01/20. The results provide a “Capacity” of 68.62%.

Table III.E.19 Royce Brook Golf Club Permit Category GW Sanitary Subsurface Sewage Disposal System (To be Discontinued in the Future)		
1. Existing facility:	Royce Brook Golf Club	
2. New Jersey Pollutant Discharge Elimination System Permit Number:	NJ0105562	
3. Discharge to ground water (DGW) or surface water (DSW):	DGW	
4. Receiving water or aquifer:	Triassic siltstone, shale, sandstone, conglomerate of the Brunswick Group

Facility Total	0.024458	0.00591

Notes/Sources: NJPDES PI Number 47566.

*Currently, this facility includes both an 18-hole "East Course and an 18-hole "West Course. A golf shop Highlander Pavilion/Garden Tent and a restaurant are also currently operated on-site.

A site-specific WQMP amendment involving this site was adopted by NJDEP in January 2016 resulting in the addition of a 99-acre portion of this tract to the SRVSA Assigned Sewer Service Area. Hillsborough Township adopted Ordinance No. 2020-17 that establishes the Royce Brook Planned Residential District (RBPRD), which allows mixed-use development that includes restaurants, banquet facilities, temporary lodging and single-family homes to be constructed on the 99-acre portion of the

tract to be served by SRVSA. The balance of the tract will remain in use as a golf course. It is anticipated that the onsite GW facility will remain in operation to serve the continued use of this site as a golf course until such time as the redevelopment of the tract is completed.

**Current/existing flow was derived from a query of the NJDEP DMR NJEMS database for the period of 08/01/15 – 08/01/20. The results provide a “Capacity” of 67.23%.

Table III.E.20 Willow School Permit Category GW Sanitary Subsurface Sewage Disposal System (To Remain in Operation)		
1. Existing facility:	Willow School

9. *Summary of current population served identifying all wastewater generating uses	
Manufacturing facility, 7 residences	
Permitted Flow:	Not Available

Notes/Sources: NJPDES PI Number 662952.

*According to the NJDEP T1 Site Information Sheet (undated), the manufacture of precision cut foils, films and glitter takes place at this facility, which is housed in converted agricultural buildings. There are also seven residences on the property. Wastewater disposal system information is not provided therein.

Table III.E.26 Somerset Hills Country Club Permit Category T1 Sanitary Subsurface Sewage Disposal System (To Remain in Operation)	
Existing Facility	Somerset Hills Country Club
1. New Jersey Pollutant Discharge Elimination System Permit Number:	NJG0141488
2. Discharge to ground water (DGW):	Yes
3. Receiving aquifer:	Precambrian gneiss, granite
4. Classification of receiving aquifer:	II-A
5. Owner of facility:	Mine Mount Land Co. C/O Somerset Hills Country Club
6. Operator of facility:	Somerset Hills Country Club 180 Mine Mount Rd., Bernardsville, NJ 07924
7. Location of facility:	
a. Municipality & County	Bernardsville Borough, County of Somerset
b. Street address	180 Mine Mount Rd., Bernardsville, NJ 07924
c. Block(s) and Lot(s)	Block 30; Lot 11
8. Location of discharge (in State Plane Coordinates)	X Coord: 468300, Y Coord: 689305
9. *Summary of current population served identifying all wastewater generating uses/	
Private Golf Course & Club House	400 members
Permitted Flow (Site Design Flow as of 9/02)	0.026 MGD

Notes/Sources: NJPDES PI Number 161456.

*According to the NJDEP T1 Site Design Flow Determination Sheet (undated) for this private country club, there are five buildings on site (clubhouse, halfway house, maintenance shop, rental house and five-bedroom single family house) which are served by multiple septic systems. The total number of members is 400.

Table III.E.27 Dunwalke Farms Permit Category T1 Sanitary Subsurface Sewage Disposal System (To Remain in Operation)	
Existing Facility	Dunwalke Farms
1. New Jersey Pollutant Discharge Elimination System Permit Number:	NJG0242900
2. Discharge to ground water (DGW):	Yes
3. Receiving aquifer:	Triassic siltstone, shale, sandstone, conglomerate of the Brunswick Group
4. Classification of receiving aquifer:	II-A
5. Owner of facility:	Kathryn Long, Andrew Allen
6. Operator of facility:	Nelson Gerlach, Farm Manager 660 Long Ln., Far Hills, NJ 07931
7. Location of facility:	
a. Municipality & County	Far Hills Borough, County of Somerset
b. Street address	660 Long Ln., Far Hills, NJ 07931
c. Block(s) and Lot(s)	Block 12; Lot 3
8. Location of discharge (in State Plane Coordinates)	Not Available
9. *Summary of current population served identifying all wastewater generating uses	
Private estate with mansion, caretaker's cottage, sports complex and other facilities.	see below
*Existing plus Future Flows	0.00154 MGD

Notes/Sources: NJPDES P.I. Number 694368.

*According to the NJDEP T1 Site Information Sheet (undated), this consists of 5 dwellings with 14 total bedrooms, a 400 sq. ft. office and 30-seat assembly area that are served by five (5) subsurface disposal systems. ******(5 units x 300 gpd) + (400*0.1) = 1540 gpd

Table III.E.28 Walgreens Permit Category T1 Sanitary Subsurface Sewage Disposal System (To Remain in Operation)	
Existing Facility	Walgreens Eastern Co., Inc.
1. New Jersey Pollutant Discharge Elimination System Permit Number:	NJG0184659
2. Discharge to ground water (DGW):	Yes
3. Receiving aquifer:	Triassic siltstone, shale, sandstone, conglomerate of the Brunswick Group
4. Classification of receiving aquifer:	II-A
5. Owner of facility:	Walgreens Eastern Co. Inc. P.O. Box 1159 Deerfield, IL 60015
6. Operator of facility:	Jeffrey Schaumberg, P.E., Consultant Walgreens Eastern Co. Inc.
7. Location of facility:	
a. Municipality & County	Franklin Twp., County of Somerset
b. Street address	3885 Sate Highway 27, Franklin Park, NJ 08823
c. Block(s) and Lot(s)	Block 5.02; Lot 53

Commercial Plaza	Two buildings as follows: 1) 40,395 sq. ft. mixed-use retail shopping plaza 2) 7,264 sq. ft. building which includes 5,264 sq. ft. of retail and 2,000 sq. ft. (50 seat) restaurant
Permitted Flow:	Not Available

Notes/Sources: NJPDES PI Number 541391.

*The NJDEP T1 Site Information Sheet (undated) does not include design or permitted flow or any descriptive information about the wastewater system serving this site.

Table III.E.29 Camp Agnes Dewitt Permit Category T1 Sanitary Subsurface Sewage Disposal System (To Remain in Operation)	
Existing Facility	Camp Agnes Dewitt Girl Scout Camp
1. New Jersey Pollutant Discharge Elimination System Permit Number:	NJG0259772
2. Discharge to ground water (DGW):	Yes
3. Receiving aquifer:	Triassic siltstone, shale, sandstone, conglomerate of the Brunswick Group
4. Classification of receiving aquifer:	II-A
5. Owner of facility:	Girl Scouts Heart of New Jersey
6. Operator of facility:	Patricia Carroll 1171 Route 28, North Branch, NJ 08876
7. Location of facility:	
a. Municipality & County	Hillsborough Twp., County of Somerset
b. Street address	605 Montgomery Rd., Hillsborough Twp., NJ 08844
c. Block(s) and Lot(s)	Block 171; Lots 6.01, 13 and 62.01
8. Location of discharge (in State Plane Coordinates):	X Coord: 424410, Y Coord: 597011
9. *Summary of current population served identifying all wastewater generating uses:	
Outdoor summer camp for Girl Scouts. Includes one (1) residential dwelling for the camp ranger, a 10,000 sq. ft. activity center completed in 2018, various platform tents, covered pavilions and other camp facilities	200 campers, unknown number of staff
Permitted Flow:	Not Available

Notes/Sources: NJPDES PI Number 738866.

The NJDEP T1 Site Information Sheet (undated) does not provide information about the wastewater facilities serving this site or permitted flows.

*A general description of this day camp is available online at <https://www.gshnj.org/en/camp/our-camps.html>

Table III.E.30 Amwell Valley Country Club Permit Category T1 Sanitary Subsurface Sewage Disposal System (To Remain in Operation)	
Existing Facility	Hillsborough Golf and Country Club (Amwell Valley Country Club)
1. New Jersey Pollutant Discharge Elimination System Permit Number:	NJG0141607
2. Discharge to ground water (DGW):	Yes
3. Receiving aquifer:	Triassic siltstone, shale, sandstone, conglomerate of the Brunswick Group
4. Classification of receiving aquifer:	II-A
5. Owner of facility:	Hillsborough Golf and Country Club/Amwell Valley Country Club P.O. Box 365, Neshanic Station, NJ 08853
6. Operator of facility:	Thompson Management LLC 195 Nassau St., Princeton, NJ 08525
7. Location of facility:	
a. Municipality & County	Hillsborough Twp., County of Somerset
b. Street address	146 Wertsville Rd., Hillsborough, NJ 08844
c. Block(s) and Lot(s)	Block 165; Lots 2, 3, 13, 14
8. Location of discharge (in State Plane Coordinates):	X Coord: 419182, Y Coord: 597452
9. *Summary of current population served identifying all wastewater generating uses	
18-Hole Golf Course, Club House, Driving Range, Bar & Grill, Pro-shop	66 employees, 300 members
Permitted Flow:	0.0044 MGD

Notes/Sources: NJPDES PI Number 162447.

*The NJDEP T1 Site Fact Sheet (undated) specifies this is an existing semi-private golf course. It contains a clubhouse with a dining area and bar with seating capacity of 40 people and maximum occupancy of 80 people, a small pro-shop, pole barn for storage, maintenance shop, one-bedroom cottage, two houses with two bedrooms each and a former hotel converted to a staff residence comprised of 12 one-bedroom apartments. Multiple septic systems serve this site.

Information about this facility was also obtained from the following website:

<https://www.hillsboroughgolf.com/facilities/>

Table III.E.31 Essex Hunt Club Permit Category T1 Sanitary Subsurface Sewage Disposal System (To Remain in Operation)	
Existing Facility	Essex Hunt Club
1. New Jersey Pollutant Discharge Elimination System Permit Number:	NJG0176532
2. Discharge to ground water (DGW):	Yes
3. Receiving aquifer:	Triassic siltstone, shale, sandstone, conglomerate of the Brunswick Group
4. Classification of receiving aquifer:	II-A
5. Owner of facility:	Essex Hunt Club
6. Operator of facility:	Essex Hunt Club 48 Holland Rd., P.O. Box 335, Peapack, NJ 07977
7. Location of facility:	
a. Municipality & County	Peapack & Gladstone Borough, County of Somerset
b. Street address	48 Holland Rd., P.O. Box 335, Peapack, NJ 07977
c. Block(s) and Lot(s)	Block 33; Lot 8
8. Location of discharge (in State Plane Coordinates):	(445860, 681478)
9. *Summary of current population served identifying all wastewater generating uses	
Private seasonal equestrian club on a 123-acre property which contains a clubhouse, three-bedroom house and equestrian stable with two 2-bedroom apartments.	5 employees and 535 members
Permitted Flow:	Not Available

Notes/Sources: NJPDES PI Number 515014.

*According to NJDEP's T1 Site Information Fact Sheet (undated), sanitary wastewater is directed to a 15,000 gallon and 1000-gallon septic tank and then to two cesspools and two disposal fields.

IV. NITRATE DILUTION-BASED SEPTIC CAPACITY ANALYSIS

A. Nitrate Dilution and Septic Capacity Analysis

Non-sewer Service Areas in Somerset County are served by individual sub-surface disposal systems (ISSDS) that discharge less than 2,000 gallons per day or less to ground water. These are also commonly referred to as septic systems. The WQMP rules at N.J.A.C. 7:15-4.5 require an evaluation of the future capacity of groundwater to sustain a nitrate standard of 2.0 parts per million (PPM) over the area of a Hydrologic Unit Code 11 (HUC 11) watershed where development will be served by ISSDS. This analysis was performed for municipalities that contain non-sewer service area within which lands with future development potential occur. The New Jersey Geological Survey developed a model that assigns a density in acres of undeveloped land per future dwelling unit/ISSDS or non-residential equivalent based on the nitrate dilution standard that is unique to each HUC11 area. The density information for the HUC11 watersheds affecting Somerset County is provided in Table IV.A.1 below. The allowable septic density is intended to sustain the nitrate standard over the area of the HUC 11 watershed when considering future additional development. Application of this density to the undeveloped acreage in the HUC11 watershed results in a total number of possible dwelling units/ISSDS that could be developed in that watershed without impairing groundwater quality and causing the nitrate concentration to exceed 2 PPM.

HUC11	Watershed Management Area	ISSDS Density
2030105050	Lamington River	4.1
2030105110	Millstone River (below/incl Carnegie Lk)	6.5
2030105060	Raritan River NB (above Lamington)	4.0
2030105070	Raritan River NB (SB to Lamington)	6.0
2030103010	Passaic River Upr (above Pine Bk br)	4.9
2030105120	Raritan R Lower (Lawrence to Millstone)	6.8
2030105040	Raritan River SB (NB to Three Bridges)	5.6
2030105080	Raritan River Lower (Millstone to NB/SB)	7.1
2030105030	Neshanic River	6.0

Undeveloped acreage is comprised of the total acreage of all lands with groundwater recharge potential including undeveloped and portions of underdeveloped parcels and permanently preserved lands. The number of allowable dwelling units/ISSDS based on the nitrate dilution standard specific to each HUC 11 watershed based on undeveloped acreage is compared with the potential number of units/ISSDS that could be created based on current zoning applied to potentially developable vacant land in the non-sewer service area buildout analysis. In order to account for the wastewater discharge associated with potential future non-residential uses based on zoning, development

potential is converted from non-residential floor area into an equivalent number of residential units using the formula provided by NJDEP. Information about previously approved development projects in non-sewered areas was also integrated into the analysis.

It is important to note that several municipalities do not have any potentially developable vacant land or approved undeveloped projects in non-sewered areas. Results are generated only for those that do, which are summarized in Table IV.A.2 below. All lands within assigned sewer service areas regardless of their development status were excluded from the analysis of septic carrying capacity. Detailed tables that present the results of the Septic Capacity Analysis comprise Appendix E. For more information about the methodology used and explanation of the results, see the Chapter III – “Future Wastewater Capacity within Non-Sewer Service Areas” of the “*Wastewater Treatment Facility & Septic Buildout and Capacity Analysis*” Report (see Appendix A). Parcel- and project-based results by municipality are presented in the spreadsheets that comprise Appendix D.

The Table IV.A.2 comprises a comparison of the allowable units within each HUC11 on a municipal basis to the number of units that could be built under existing zoning. A potential septic capacity deficit has been identified for the portion of HUC11 No2030103010 - Passaic River Upr (above Pine Bk br) in Bernards Township.

Table IV.A.2: Comparison of Zoning-based and Nitrate Dilution Standard-based ISSDS by Municipality and HUC11				
Municipality	HUC11	Total DU/ISSDS	Allowable ISSDS	Compliant
Bedminster Township	2030105050/Lamington River	134.0	897.6	Yes

V. STRATEGIES FOR ADDRESSING POTENTIAL CAPACITY DEFICIENCIES

In accordance with the WQMP Rules at N.J.A.C. 7:15-4.3(a)3, the following chapter contains “a brief summary of actions proposed in the WMP including a description of the number of acres added and/or subtracted from the area eligible for sewer service and strategies to address any potential capacity deficiencies identified in the wastewater treatment capacity or nitrate dilution analyses”. It is important to note that the addition or subtraction of lands from Assigned Sewer Service Areas is not proposed at this time as part of the strategies for addressing potential capacity deficits, which focus on providing “Strategies that demonstrate the potential to address capacity deficiencies identified through the analyses” in accordance with the WQMP Rules at N.J.A.C. 7:15-4.3(a)4v.

N.J.A.C. 7:15-4.5(b)7 specifies that “If infrastructure improvements are expected to be needed within five years, the wastewater management planning agency shall begin coordinating with the Department and the entity responsible for the applicable wastewater treatment facility to evaluate the technical feasibility and establish a schedule within which various steps will be taken to accomplish installation of the improvements”. SRVSA and WTSA have been working with NJDEP on an ongoing basis for this purpose.

There are no unassigned sewer service areas within Somerset County. Therefore, N.J.A.C. 7:15-4.5 (b)3.ii does not apply.

A. Strategies for Addressing Potential WWTF Capacity Deficits in Assigned Sewer Service Areas

According to N.J.A.C.7:15-4.5(b)5, “For existing permitted wastewater treatment facilities, where the existing flow is 80 percent or more of the permitted flow at the time of WMP development, the wastewater management planning agency shall coordinate with the Department and the entity responsible for the applicable wastewater treatment facility to determine if remaining projected growth will result in a capacity deficiency and, if the potential for a capacity deficiency exists, to analyze effective strategies to address this potential deficiency”. As shown in Table III.B.1 above, existing/current flows were found to exceed 80% of permitted flows for the Harrison Brook WWTF (88.32%), SRVSA WWTF (103.93%), Warren Stage I & II WWTF (99.93%), and Warren Stage IV WWTF (96.25%). Chapter II.C, “*Wastewater Treatment Facility Capacity Analysis*” of the “*Wastewater Treatment Facility & Septic Buildout and Capacity Analysis Report*” (see *Appendix A*) and summarized in Table III.C.3 above also shows potential future capacity deficits at the Harrison Brook WWTF (96.96%), SRVSA WWTF (119.95%), Warren Stage I & II (129.06%) and Warren Stage IV (122.65%). The operators/managers of these facilities were notified in writing of the results of the Wastewater Treatment Facility Capacity Analysis in December 2020 and January 2021 and asked to collaborate with the County and NJDEP to identify potential capacity solutions. They were referred to the NJDEP’s CPP Guidance document available at the following link: <https://www.nj.gov/dep/wrm/docs/cpp.pdf> for information about the strategies and tools that are deemed acceptable by NJDEP for addressing wastewater treatment capacity deficits. The following strategies for addressing potential capacity deficiencies were identified through this collaborative process:

1. Harrison Brook: According to Thomas Timko, P.E., C.M.E., Bernards Township Engineer and Bernards Township Sewerage Authority Director, “In 2020 the Township of Bernards Sewerage Authority began an aggressive Inflow and Infiltration (I & I) Investigation Program to identify and eliminate I & I in the system. Related construction contracts will be bid as each inspection and smoke testing contract concludes”.
2. SRVSA: In his letter of March 1, 2021, James Cosgrove, Jr., P.E. Vice President/Principal of Kleinfelder on behalf of SRVSA provides the following evaluation and identification of strategies to address the potential WWTF capacity deficit between SRVSA’s existing treatment flow of 23 MGD and the estimated buildout flow of 29.159 MGD.:

Background: Although SRVSA’s current WWTP is designed for 23.0 MGD, its NJPDES permit provides for flows of 23.0 MGD, 24.31 MGD, and 29.0 MGD. Therefore, from a permitting perspective, the effluent limits at 29.0 MGD will accommodate nearly the entire 29.159 MGD flow. From a design capacity issue, SRVSA will soon propose to re-rate its facility to 24.31 MGD, still leaving nearly 5 MGD of capacity deficit.

Sewer Treatment Plant Expansion: In order to accommodate the estimated buildout flow, it will be necessary for SRVSA to expand its wastewater treatment plant. Even if the additional strategies summarized below are successful, we do not expect that an annual average flow reduction of nearly 5 MGD could be accomplished. SRVSA expects that it could be many years before an expansion will be necessary, but it will continue to carefully monitor its flows so that it can plan for an expansion when such is required.

Maximization of Existing Conveyance and Treatment Infrastructure: SRVSA is currently constructing the Storm Control Treatment Facility (SCTF), which is expected to be completed within the next year. The SCTF will treat excess wastewater mixed with stormwater during high flow conditions, after heavy rainfall events when the SRVSA interceptor becomes surcharged. This new treatment facility is expected to shave off 9 MGD of flow during peak flow times, which will reduce annual average flows. Had the SCTF been in operation during 2018 when NJ experience its wettest year on record, the average flow would likely have been lower than 25 MGD, allowing for additional treatment capacity at the SRVSA WWTP.

Water Conservation Strategies: SRVSA has measured reduced flows during dry weather periods due to changes in plumbing fixtures (low flow toilets, reduced flow faucets, energy efficient washing machines may account for a 10% reduction). While additional water conservation strategies may further reduce flows during low flow periods, we do not expect these strategies to have a meaningful impact on annual average flows.

Inflow and Infiltration Reduction: Theoretically, inflow and infiltration (I/I) reduction could reduce the capacity deficit substantially; however, SRVSA does not own or operate the municipal collection system and even if it did removing I/I to the level necessary would be extremely expensive (~\$100M) and would take decades to accomplish. Unfortunately, as one part of the system is repaired another section is aging and leaks are increasing. A successful I/I program may reduce flows, but likely not sufficiently to alleviate the capacity deficit.

Reduction of Sewer Service Area: SRVSA's member municipalities rely on SRVSA to treat their wastewater. SRVSA does not have the authority to reduce the sewer service area, nor does it believe it would be appropriate to do so. It is up to the member municipalities to determine the sewer service area they wish to be served.

Zoning Changes/Land Use Policies: Here again, zoning is not the responsibility of SRVSA. The buildout analysis is based on existing zoning. That zoning translated to a future flow at SRVSA of 29.159 MGD, which is very close to it's permitted flow of 29 MGD. SRVSA has conducted all the proper planning for a flow of 29 MGD, including an anti-degradation study on the Raritan River and obtaining a permit modification from NJDEP to include effluent limits at 29 MGD.

Open Space Acquisition: As stated above, this is also a responsibility of the municipalities, not SRVSA. Acquiring open space that is suitable for development

and therefore contained within the building analysis would lower the buildout flow. However, it is important to note that 1/3 of the projected new future flow is from affordable housing, which is legally mandated. The municipalities may need open space to fulfill their affordable housing obligations.

Voluntary Sewer Bans: Sewer bans would be the absolute last line of defense as a strategy to mitigate sewer capacity deficiency. In SRVSA's opinion, a sewer ban is necessary only when improper planning has occurred, or some highly unexpected phenomenon occurs. SRVSA has planned for an ultimate flow of 29 MGD, as evidenced by its NJPDES permit with that flow. As the municipalities buildout, SRVSA will continue to monitor flows and will expand its WWTP to accommodate the flow.

3. Warren Stage I & II and Warren Stage IV: According to Spencer Pierini, Director of the Warren Township Sewerage Authority (WTSA) which owns and operates both facilities, "in 2019 and 2020, the WTSA performed cured-in-place pipe lining and manhole rehabilitation within its Stage I & II and Stage IV Assigned-Sewer Service Areas as a means to combat inflow and infiltration (I & I). The flow reductions achieved from this effort will be used to serve the WTSA's short-term service needs while it evaluates the need for additional I & I reduction efforts and/or the expansion of the Stage I & II and Stage IV Wastewater Treatment Plants".

The operator/manager of the Bernardsville WWTF was also notified in December 2020 of potential existing/current capacity deficits since existing/current flows for this facility were found to be 79.75%, very close to the 80% of permitted flow threshold identified in N.J.A.C.7:15-4.5(b)5. However, total future flow to this facility was estimated to be below 95% of permitted flows (86.46%) according to the Wastewater Treatment Facility Capacity Analysis herein. As such, this facility does not have an imminent need for solutions to potential capacity deficits. Given the 10-year horizon for this WMP Component, and potential changing circumstances resulting from the planned redevelopment project being considered at the quarry site and other potential growth within the Borough that were not taken into consideration in this analysis, the operator/manager of this facility was notified and encouraged to be prepared to take appropriate action in the event increased flows from future development lead to potential capacity constraints.

B. Strategies for Addressing Potential Septic Capacity Deficiencies in Non-Sewer Service Areas

Chapter III, "Future Wastewater Capacity Analysis within Non-Sewer Service Areas" of the *"Wastewater Treatment Facility and Septic Buildout and Capacity Analysis"* (see Appendix A) indicates that the Passaic River Up (above Pine Bk br) HUC11, which covers portions of Bernards, Bernardsville and Far Hills would potentially exceed the allowable number of ISSDS based on the Nitrate Dilution Standard if fully developed under current zoning regulations. The potential deficit applies to the Bernards Township portion of this HUC11, while surpluses have been identified in the other two municipalities.

According to N.J.A.C. 7:15-(2)v, “If the future nitrate dilution capacity is insufficient to meet the projected loading from future development, the local government unit shall work with the Department to evaluate options to address this capacity gap”. For the purpose of this analysis, it is inconsequential if one municipality’s zoning yield exceeds the allowable yield based on the septic density standard for its portion of a particular HUC 11, provided that the allowable yield for the entire HUC11 is not exceeded based on the combined zoning yield for all municipalities pertaining to the affected HUC11. Therefore, data for the other two municipalities in Somerset County with zoning yields pertaining to HUC11 No. 2030103010 -Passaic River Upr (above Pine Bk Br)” is included in Table V.A.1. This table shows a net deficit of 20.5 units applicable to Bernards Township. It is important to note that a substantial portion of this HUC11 watershed lies in Morris County, and a smaller portion lies in Union County. It is possible that a net capacity surplus could exist in the areas of the watershed that lie outside of Somerset County that can off-set any potential deficit in Bernards Township, especially since there are low-density development patterns and significant public open space (including the 7,800-acre Great Swamp Wildlife Refuge) in this portion of the sub-watershed.

Table V.A.1: HUC11 ISSDS Yield - Passaic River Upr (above Pine Bk br)			
Municipality	Total ISSDS based on Zoning	Total Allowable ISSDS based on Nitrate Dilution Standard	Surplus/(Deficit)
Bernards Township	75.0	39.5	(35.5)
Bernardsville Borough	16	17.5	1.5
Far Hills Borough	8.0	21.5	13.5
TOTAL	99	78.5	(20.5)

Elected officials, the Bernards Township Wastewater Management Planning Committee and other Township representatives were notified of the aforesaid potential future septic capacity deficits in correspondence from the Somerset County Planning Division in December 2020 and January 2021. A remote meeting took place in January 2021 at which this matter was discussed in greater detail. The CPP, which is posted on the NJDEP’s Website at the following link: <https://www.nj.gov/dep/wrm/docs/cpp.pdf> describes several types of strategies that can be used to address potential capacity deficiencies was taken into consideration, in addition to information provided in other NJDEP- adopted County WMPs.

According to Thomas Timko, P.E., C.M.E., Bernards Township Engineer and Bernards Township Sewerage Authority Director, “The Township of Bernards will retain the Township’s consultant engineer, Mott MacDonald, to advise and assist the Township with the development of strategies to address potential future capacity deficits in the portion of the Township that is within the HUC11- Passaic River Upr (above Pine Bk br).”

A municipal chapter has been included in the Somerset County Septic Management Plan for Bernards Township that effectuates the establishment of a formal municipal septic management program. It includes an inventory of properties served by individual sub-surface sewage disposal systems (ISSDS), a summary of current practices and future initiatives.

NJDEP will use its regulatory authority under N.J.A.C. 7:15 and other laws to ensure compliance with the 2 mg/L nitrate dilution standard for any development regulated by NJDEP. Developments that do not require any NJDEP approval will not be affected.

I. Introduction

This Wastewater Treatment Facility Buildout and Capacity Analysis report is prepared on behalf of the Somerset County Planning Division (“SCPD”) for incorporation into the Somerset County Wastewater Management Plan (“WMP”). This report outlines the buildout methodology, assumptions and results for sewer service areas and non-sewer service areas within Somerset County, New Jersey. This analysis has been prepared in accordance with the New Jersey Department of Environmental Protection (“NJDEP”) Water Quality Management Planning Rule (“WQMP”) (N.J.A.C. 7:15-et al).

Municipal Review

This report has been distributed to the municipalities of Somerset County for review and comment. Municipal wastewater management committees in each community were requested and encouraged to review the draft results of the WMP Analyses and provide feedback in terms of site-specific changes/updates based on current local information on the land use, development, construction or preservation status for use in refining the results and improve accuracy. Comments received have been reviewed and incorporated into the analysis as appropriate.

II. Future Wastewater Capacity within Sewer Service Areas

The WQMP Rules require that, for each assigned sewer service area in urbanized and non-urbanized municipalities, the sum of existing flow and projected future flow be compared with the current permitted flow specific to each wastewater treatment facility. This section of the report addresses 19 of the 21 municipalities in Somerset County that are serviced by wastewater treatment facilities that discharge to surface water. Montgomery Township and Rocky Hill Borough are excluded from this report since a wastewater capacity analysis was included in the Montgomery Township and Rocky Hill Borough WMP Component, adopted by NJDEP on November 4, 2019. Additionally, wastewater treatment facilities that discharge to groundwater are not included in the analysis. Figure 1 identifies the domestic wastewater treatment facilities that serve the public sewer systems within these 19 municipalities for which this analysis was performed.

A. Wastewater Demand Projections in Urbanized Municipalities

The NJDEP WQMP Rule (N.J.A.C. 7:15-1.15) defines an “urbanized municipality” as a municipality where 90 percent of the municipality’s total land area appears as “Urban” as designated in the NJDEP 2012 Land Use/Land Cover geographical information systems (GIS) database. Urbanized municipalities also include those municipalities identified as "Urban Aid" municipalities pursuant to the New Jersey Redevelopment Act, N.J.S.A. 55:19-20 et seq.; as an Urban Enterprise Zone pursuant to the New Jersey Urban Enterprise Zones Act, N.J.S.A. 52:27H-60 et seq.; as a "Garden State Growth Zone" municipality pursuant to the New Jersey Economic Opportunity Act of 2013, N.J.S.A. 52:27D-489p et seq.; and as Transit Villages approved by the New Jersey Department of Transportation and NJ Transit.

Based on this definition, three municipalities within Somerset County qualify as urbanized municipalities: Bound Brook Borough, North Plainfield Borough, and Somerville Borough. North Plainfield has more than 90 percent urban lands, Bound Brook was designated as a Transit Village in 2003, and Somerville was designated as a Transit Village designated in 2010. Somerville is part of the Somerset Raritan Valley Sewer Authority’s (SRVSA) Assigned Sewer Service Area. As such, existing and future flows from this municipality are served by the SRVSA wastewater treatment facility in Bridgewater. Bound Brook and North Plainfield are part of the Middlesex County Utility Authority’s (MCUA) Assigned Sewer Service Area, served by the MCUA wastewater treatment facility in Sayreville.

Estimating future wastewater flows in urbanized municipalities assumes that redevelopment of previously developed portions of the municipality will make up the majority of any additional wastewater demand since there is scarce vacant land for new development. In these instances, an analysis of future

development potential based solely on the zoning of the undeveloped and developable land area of the municipality is likely to underestimate their future wastewater management needs. As such, the WQMP Rules provide that urbanized municipalities estimate future wastewater flows based on the population increase projected within a 20-year planning horizon from the date of WMP preparation. The wastewater demands estimated from these population projections is then added to certain known variables for future growth in each community, including planned major non-residential new development and redevelopment projects.

Future Wastewater Flow Projections

Population Projections

Calculations of the baseline and horizon populations utilize information prepared by New Jersey Transportation Planning Authority’s (“NJTPA”) Demographic and Employment Forecast Model (“DEFM”) for its 2045 Demographic Projections. The DEFM allocates growth based on several factors, such as historical growth rates, available land, and transit/highway connectedness. NJTPA’s process begins with projections at the county level and, once established, the county population forecasts are distributed among Traffic Analysis Zones (TAZ) and municipalities. The NJTPA then prepares population growth projections for each municipality for a 30-year period from the 2015 baseline year. The projections provided by NJTPA include the baseline year 2015, horizon year 2045, and a measurement of Annualized-Percent Population Change (“APPC”)—a growth factor used to estimate annual population increases.

For the purpose of this analysis, however, a 20-year population projection from 2020 to 2040 is necessary to estimate future wastewater demands. Using the APPC growth factor, the 2015 population is multiplied by the Annualized-Percent Population Change over a 5-year and 25-year period to estimate populations for 2020 and 2040 (see Figure 2).

Figure 2: Population Projections for Urbanized Municipalities in Somerset County

Urbanized Municipalities	2015 Population	Annualized % Population Change 2015-2045	2020 Population	2040 Population	Population Change 2020-2040
Bound Brook Borough	11,383	0.305%	11,558	12,284	726
North Plainfield Borough	22,088	0.239%	22,354	23,448	1,094
Somerville Borough	12,742	0.737%	13,219	15,312	2,093

To estimate future wastewater flows from population growth, the NJDEP standard wastewater multiplier of 75 gallons per day (GPD) per person was used for each of the urbanized municipalities, assuming that the projected population will be served by public sewers. The base year population for each urbanized municipality was subtracted from the 2040 WMP horizon year, the difference of which was then multiplied by 75 GPD to calculate the projected future wastewater flow. (Figure 3)

Figure 3: Wastewater Flows from Projected Population Growth

Municipality	Projected Population Growth (2020-2040)	Projected Wastewater Flow (GPD)
Bound Brook	726	54,450
North Plainfield Borough	1,094	82,050
Somerville Borough	2,093	156,975

Anticipated Non-Residential Development

To calculate future anticipated wastewater flows from approved non-residential development projects (Figures 4 and 5); NJDEP wastewater multipliers for future development were utilized. Non-residential development is assumed to produce 0.100 GPD per square foot of floor area.

Figure 4: Wastewater Flows from Approved Undeveloped Non-Residential Projects					
Municipality	Project Name	Block	Lot	Sq. Ft.	Wastewater Flow (GPD)
North Plainfield	Gas Station/Retail	204	3	3,993	400.0

Somerville	Somerville Town Center - Phase III (wellness center, retail)	117.01	1.03	86,366	8,636.6

Treatment Works Approvals

The Treatment Works Approval (TWA) program, administered through the NJDEP, regulates the construction and operation of both industrial and domestic wastewater collection, conveyance and treatment facilities. TWAs are a type of construction permit wherein development projects are evaluated to ensure wastewater facilities can address their effluent treatment needs. The NJDEP provided a list of TWA permits in Somerset County in January 2020, which lists the approved permitted design flows for projects that will contribute to wastewater flows. Somerset County staff utilized current available satellite imagery and land development review data maintained by the SCPD to determine the construction status of each TWA project. Projects deemed to be complete were excluded from the analysis to avoid “double-counting” since the wastewater flows generated therefrom is accounted for as part of existing flows. Some of the TWA projects have both residential and non-residential components that will generate wastewater (see Figure 6). In these cases, non-non-residential wastewater demand was calculated by multiplying the number of proposed sq. ft. by the GPD factor of 0.100 provided in the WQMP Rules. This sum was subtracted from the project-specific TWA Design Flow provided by NJDEP to derive wastewater flows associated with the residential component.

Figure 6: Proposed Development Projects with Treatment Works Approvals

Municipality	TWA No.	Address	Block	Lot	Res. Units	Non-Res. Sq. Ft.	TWA Design Flow (MGD)	Res. Flow (GPD)	Non-Res. Flow (GPD)
Bound Brook	18-0008	7-15 W. Main St.	7	28	63	6,000	0.0122	11,600	600

Projected Increase in Wastewater Flows for Urbanized Municipalities

The anticipated non-residential wastewater flows from these projects were then added to the increase in wastewater flows based on projected population growth over the 2020-2040 period (Figure 7) to establish total additional wastewater flows. Based on these figures, 173,994.5 GPD are to be addressed by the SRVSA WWTF located in Bridgewater; and 142,468 GPD are to be addressed by the MCUA WWTF located in Sayreville.

Municipality	Projected Increase in Wastewater Flow from Projected Population Growth (GPD)	Projected Increase in Wastewater Flow from Non-Residential Development (GPD)	Total Projected Increase in Wastewater Flow (GPD)
Bound Brook	54,450	1,505	55,955
North Plainfield	82,050	400	82,450
Somerville	156,975	17,019.5	173,994.5

B. Wastewater Demand Projections in Non-Urbanized Municipalities

Methodology and Assumptions

The WQMP Rules require that for each assigned sewer service area in non-urbanized municipalities, the sum of existing flow and projected future flow be compared with the current permitted flow specific to each wastewater treatment facility. This analysis addresses 16 of the 18 municipalities in Somerset County that are “non-urban municipalities” in accordance with N.J.A.C. 7:15-4.5(b)1ii(2). The Montgomery Township and Rocky Hill Borough WMP Component adopted by NJDEP on November 4, 2019 provides this analysis for these two non-urban municipalities.

To calculate future wastewater flows in Somerset County’s non-urbanized municipalities, a GIS-based build-out analysis has been conducted utilizing the methodology provided in the Appendix. Existing development conditions, regulated environmental features, zoning information and contracted flows were reviewed for each lot to calculate potential build-out flow in accordance with N.J.A.C. 7:14A-23.3.

Figure 1 identifies the domestic wastewater treatment facilities that serve the public within these 16 non-urbanized municipalities, for which this analysis was performed. The build-out analysis results are based on the on potential future development that may occur within the limits of the assigned sewer service areas of each non-urbanized municipality. It is assumed that all future development of properties identified as potentially developable vacant land (“PDVL”) in the SCPD GIS dataset within assigned sewer service areas will contribute to wastewater flows.

For this analysis, the permitted uses and associated density factors of each municipal-specific zoning district included in the GIS base-zoning dataset provided by the SCPD was applied to PDVL. Zoning districts are characterized herein as residential, non-residential, or mixed-use development. Future residential units are assumed to produce an average of 300 GPD per unit¹; future non-residential development is assumed to produce 0.100 GPD/square foot of floor area². If a zone is deemed mixed-use, a ratio of residential to non-residential development was used, as provided in the GIS base-zoning dataset. The PDVL and base zoning datasets were developed by the SCPD in collaboration with municipal WMP Committees and municipal staff and consultant planners for the purpose of performing this analysis and are the most accurate versions of this type of data at a countywide level currently available.

The SCPD in collaboration with municipal WMP Committees and planners also collected and compiled in GIS format information on approved undeveloped projects, planned redevelopment, proposed residential development pursuant to the Mount Laurel IV Declaratory Judgement Process, proposed projects with TWA and sites served by septic systems within assigned sewer service areas for which future wastewater flows was determined and added to potential future flows from PDVL. Care was taken to exclude these from the PDVL dataset and other steps were taken to avoid double-counting of flows where GIS dataset overlaps occurred.

Where source data overlaps (i.e. the same property appears in more than one dataset), the following hierarchy determined which data to utilize:

1. Treatment Works Approval (TWA) issued by the NJDEP
2. Affordable Housing Projects

¹ The NJDEP projected flow standard for future residential units with three (3) or more bedrooms is 300 GPD.

² The NJDEP projected flow standards for retail and office uses is 0.100 GPD/sq. ft.

3. Redevelopment Projects
4. Approved Projects
5. Potential Developable Vacant Land (PDVL)

While the analysis performed in this report is assumed to be accurate and conservative to the extent possible, flow projections of this scale have inherent variability. This flow projection does not consider any future variances that allow construction that does not conform to zoning; amendments to development/redevelopment plans; changes to municipal ordinances; and/or future open space and farmland preservation.

Build-Out Analysis of PDVL in Non-Urbanized Municipalities

The build-out analysis utilized the SCPD's potentially developable vacant land (PDVL) layer of undeveloped lands, which was developed in 2012 and updated and maintained by SCPD staff through 2019. It is assumed that all development will comply with the maximum density or maximum floor area allowed by zoning. In the case of residential development, any development potential resulting in a fraction of a residential unit is rounded down to the nearest whole unit. Development yield also takes into account how density is defined (net or gross acreage) in municipal zoning ordinances.

Preserved open space and farmland, roads, railroads and utility rights-of way lands categorized as "Urban" in NJDEP's Land Use/Land Cover dataset and other developed lands identified through the use of the NJ Department of Community Affairs ("NJDCA") Certificate of Occupancy data and a review of current aerial photography; and land constrained by wetlands and C1 buffers, were excluded from potential developable land within the non-urbanized municipalities. Parcels located within one of the County's assigned sewer service areas associated with WWTFs that discharge to surface water are included in this analysis. Parcels located in more than one zone district are assumed to be subdivided along the zone boundary and treated as separate lots, for the purposes of this analysis.

Residential Zone Districts

Determining the development potential for residentially-zoned lots begins with a determination of whether the lot meets the minimum-required lot area specified by the zone. If the lot meets the minimum lot area, the number of potential dwelling units permitted by the zone is then calculated based on the maximum permitted density. Properties that yield a fractional number of dwelling units are rounded down to the nearest whole number of units.

Contiguous undersized parcels located within the same zone district are then reevaluated to determine whether merged lots could meet the zone's minimum lot size requirement. If the merged lots would meet the zone's minimum lot size and density requirement, the number of dwelling units are calculated using the above method.

Non-Residential Zone Districts

The determination of non-residential buildout potential utilizes a similar methodology. Non-residentially-zoned parcels that meet the minimum lot area requirement for the zone are then evaluated for development potential. Contiguous undersized parcels located within the same zone district are then reevaluated to determine whether merged lots could meet the zone's minimum lot size requirement. The total potential square footage of the non-residential development is calculated by multiplying the lot area by the zone's maximum floor area ratio (FAR) per the GIS base zoning dataset.

Mixed Use Zone Districts

Parcels in mixed-use zones are evaluated based on a ratio of residential to non-residential uses. First, residential and non-residential development potential is calculated for each use using the above-described methods, respectively. Once these values are calculated, the estimated “mix” of residential dwelling units and non-residential square footage is calculated based on a ratio of residential to non-residential, which was established by SCPD for each zone district. For example, if the residential to non-residential ratio is 0.5:0.5, then each value is multiplied by 0.5. If, however, it is found the parcel cannot accommodate at least one residential dwelling unit, the residential to non-residential ratio provided by SCPD is first superseded, then the new ratio becomes 0:1 non-residential, indicating the parcel can only accommodate a non-residential use. Similar to the residential and non-residential analysis, contiguous undersized parcels within mixed-use zones were evaluated to determine if merging lots would meet the minimum lot area. For this analysis, no parcels met this criterion for combined lots.

Overlay Zone Districts

Several non-urbanized municipalities have overlay zones, which provide for additional development options beyond what is permitted in the underlying zone district. For the purposes of this analysis, it is assumed that whichever use permitted in either the underlying zone or the overlay that yields the greatest wastewater demand will be utilized. The projected wastewater demand for the overlay zoning is calculated based on the residential, non-residential and mixed-use methodology above. The parcels within a sewer service area are matched to their overlay zones, the projected flow is calculated utilizing a buildout analysis of residential and non-residential wastewater generation, then the results are compared to the parcels’ underlying wastewater generation from its prior zoning. However, upon analysis of the overlay zones throughout Somerset, none yield a wastewater demand higher than any underlying zoning, so no flow from an overlay zone was used in the overall calculation.

PDVL Buildout Results

The buildout analysis of the non-urbanized wastewater service areas projects a total of 1,060 residential units and 12,140,463 square feet of non-residential development associated with Potentially Developable Vacant Land based on current zoning. Buildout results are summarized by municipality and zone in Figures 8, 9 and 10 below. Buildout results for each individual parcel are available in the Appendix.

Wastewater Flows Based on Buildout

For residential development, wastewater flows were calculated based on the assumption that the wastewater contribution from each residential unit would be 300 gallons per day. For non-residential development, wastewater demands were calculated based on a wastewater demand of 0.100 gallons per day per square foot. Wastewater demands for mixed use development were calculated using both methods for residential and non-residential development, then calculating the ratio of residential to non-residential use for a given zone. Once these values are calculated, they are multiplied by 300 GPD per unit and 0.100 GPD/sq. ft., respectively, and then added together to calculate the total GPD for the lot.

Wastewater Flows from Other Data Sources

Treatment Works Approvals

The TWA program, administered through the NJDEP, regulates wastewater collection, overseeing the construction and operation of both industrial and domestic development. Each TWA permit has a permitted design flow approved by NJDEP. The NJDEP provided a list of TWA permits in January 2020, which lists the approved permitted design flows for projects that will contribute to wastewater flows. SCPD staff utilized current available satellite imagery and land development review data maintained by the SCPD to determine the construction status of each TWA project. Projects deemed to be complete were excluded from the analysis to avoid “double-counting” since the wastewater flows generated therefrom is accounted for as part of existing flows. Figure 11 below shows the summary of approved TWA permits by municipality. The Appendix contains a listing of each TWA permit.

Figure 11: Treatment Works Approvals

Municipality	Facility Name	Units	Sq. Ft.	GPD
Bernards Township	Harrison Brook STP	3	4,216	1,322
Branchburg Township	Somerset Raritan Valley SA	0	149,246	67,900

Anticipated Affordable Housing Development in Non-Urbanized Municipalities

The analysis also incorporates future flows associated with planned affordable housing projects using GIS data provided by the SCPD. These sites were excluded from the GIS PDVL layer and other contributing source layers. Of Somerset County's non-urbanized municipalities, 13 have planned affordable housing projects pursuant to the Mount Laurel IV Declaratory Judgement process, which are documented in executed settlement agreements with the Fair Share Housing Center and amended Housing Elements and Fair Share Plans, which have been deemed compliant by the Court. Figure 12 provides additional detail for projected future development and wastewater flows associated with planned affordable housing projects. To calculate future anticipated wastewater flows from these planned development projects, NJDEP's approved wastewater multipliers of 300 GPD per unit was applied.

Figure 12: Affordable Housing

Anticipated Approved-Development in Non-Urbanized Municipalities

It is assumed that undeveloped properties with site plan or subdivision approvals from municipal planning and zoning boards will be developed as per the development approvals rather than the current zoning. Such development would contribute to wastewater flows based on either their residential or non-residential character, as per the SCPD’s parcel-based Approved Undeveloped Projects GIS layer. Lands included in SCPD’s Approved Undeveloped Projects layer were omitted from SCPD’s GIS PDVL layer (see Figure 14). Approved undeveloped projects that are partially in a sewer service area were included, assuming the development will take place on the portion of the parcel located within the assigned SSA Residential wastewater demand will remain at 300 GPD per unit and non-residential wastewater demand will remain at 0.100 GPD/sq. ft. for approved undeveloped projects.

Many sites included in the SCPD’s GIS Approved Undeveloped Projects layer which was prepared during 2018 and 2019 are included in a dataset of TWA projects provided to the SCPD by NJDEP in January 2020. Where these overlaps occur, the project and design flow information in the TWA Project Dataset supersedes the information in the Approved Undeveloped Projects layer. Sites that have been developed as of March 2020 have been excluded from this analysis.

Figure 14: Approved Undeveloped Projects

Anticipated Septic to Sewer Conversions

Within the sewer service areas of the non-urbanized municipalities, there are existing developed properties that are served by individual subsurface septic disposal systems (ISSDS). NJDEP WQMP Rules require that these properties be included in the analysis, assuming that at some point in the future, each of these properties will abandon the septic system and connect to the sewer system. The SCPD has provided a list of all properties served by ISSDS. Residential and farmland properties are assumed to contain one residential unit per lot with a projected flow of 300 GPD. For existing commercial properties (Class 4A), since the actual floor area square footage was not readily available, the existing floor area is assumed based on the maximum permitted floor area within the zone district in which the property lies. Figure 15 below provides a summary of the anticipated conversions from septic to sewer.

Figure 15: Anticipated Septic Conversions to Sewer

Projected Increase in Wastewater Flows for Non-Urbanized Municipalities

The anticipated demands from the approved projects, treatment works approvals, build-out, and anticipated affordable housing projects were then added together to establish the total additional wastewater demand of all non-urbanized municipalities (Figure 16).

C. Wastewater Treatment Facility Capacity Analysis

Methodology and Assumptions

This section of the report compares the sum of the existing and future wastewater flows to the permitted flows for each wastewater treatment facility as reported by the NJDEP. Existing flows are calculated as the greatest consecutive 12-months rolling average over the most recent five-year period preceding development of the WMP, in accordance with N.J.A.C. 7:15-4.5(b)(1)(i). Future flows are based on the results of the wastewater flow projections for urbanized municipalities and build-out analysis of non-urbanized municipalities. Only wastewater treatment facilities that discharge to surface water are included in this analysis. Wastewater treatment facilities that discharge to groundwater, including industrial uses, golf courses, schools, farms, and other similar individual uses are not included in this analysis.

Greatest 12-Month Rolling Average

The Discharge Monitoring Report (DMR) was used to calculate the 12-month rolling average for each facility, which was collected from NJDEP’s DataMiner program. The DMRs provide one-month averages of wastewater flows (in conduit or through a treatment plant). The 12-month rolling average represents the greatest 12-month period throughout five years—between January 1, 2015 and March 1, 2020—that discharged the largest amount of wastewater. To calculate this, for example, the flow month 1 through month 12 was averaged, then month 2 through 13, and so on. The 12-month period that produced the greatest flow was then used as the existing flow. Figure 17 indicates the 12-month period that yields the greatest average flow for each treatment facility.

Figure 17: Sewer Service Areas within Non-Urbanized Municipalities

Facility Name	NJPDES #	Greatest 12-Month Period
Berkeley Heights Water Pollution Control Plant	NJ0027961	February 2018 - January 2019

Stony Brook Regional S.A.	NJ0031119	February 2018 - January 2019
Warren Stage I & II	NJ0022489	August 2018 - July 2019
Warren Stage IV	NJ0022497	August 2018 - July 2019
Warren Stage V	NJ0050369	February 2018 - January 2019

Wastewater Treatment Plan Capacity Analysis

Figure 18 below displays the calculations of total future wastewater projections for each sewer service area based on the sum of existing flows and future flow projections from both urbanized and nonurbanized municipalities served by the wastewater facility. The future flow projections of the urbanized and non-urbanized are shown in the Future Flow (MGD) column. Each wastewater facility’s permitted flow capacity, evaluated as a plant’s permitted design flow, was collected from the NJDEP’s Capacity Assurance Program.

To find the percent to capacity, a plant’s existing flow and future flow is first added together to receive a plant’s total flow. Then the total flow is divided by the capacity, indicated the percent to a facility’s

permitted capacity before it creates adverse impacts, such as discharging into drinking water supplies, for example.

Figure 18: Wastewater Treatment Facility Capacity Analysis

Facility Name	Permitted Flow (MGD)	Existing Flow (MGD)	Municipalities Served	Future Flow (MGD)	Total Flow (MGD)	Percent Capacity

* These Wastewater Treatment Facilities are operated outside of Somerset County. These results shall be incorporated into the Union County WMP and Middlesex County WMP.

As shown in Figure 18 above, several wastewater treatment facilities in Somerset County will exceed their permitted flow capacity at full buildout. The Somerset County WMP will need to recommend strategies to address these capacity deficiencies. It is noted that the NJDEP Capacity Assurance Program is required when a wastewater treatment plant's average flow over 12 consecutive months, as reported in DMRs, reaches or exceeds 95% of the permitted flow. The flow limit for the program was increased from 80% to 95% in May 2017.

As indicated in Figure 17, the greatest 12-month rolling average for SRVSA is 25.265 MGD recorded from August 2018 to July 2019. The former American Cyanamid site, located in Bridgewater Township, is designated as a Superfund Site by the US EPA. Until sometime in 2019, SRVSA had been treating approximately 650,000 GPD of groundwater from the American Cyanamid/Pfizer site plus an additional 50,000 GPD from Lagoon 7 for a total of 700,000 GPD. On-site treatment facilities associated with the EPA-approved clean-up plan have since been installed and are in operation. The SRVSA reports that flows of approximately 500,000 GPD are still being treated from the Pfizer site plus the 50,000 GPD from Lagoon 7. Since the existing flows include the higher wastewater flows from the Pfizer site, the SRVSA has therefore recommended that the existing flow projection be reduced by 150,000 GPD to reflect the anticipated future flows from Pfizer moving forward. Accordingly, Table 18 shows the reduction of 0.150 MGD for the American Cyanamid/Pfizer site under Bridgewater Township's future flow projections.

III. Future Wastewater Capacity within Non-Sewer Service Areas

A. Build-Out of Future Septic Systems in Non-Sewer Service Areas

General Methodology and Assumptions

To perform the future wastewater discharge evaluation for Somerset County's non-urban municipalities, a hypothetical build-out was conducted to evaluate potential wastewater from future development in the areas of Somerset County located outside the sewer service area (non-sewer service area). It was assumed that all future development of properties (vacant lots that are deemed to have the potential for development) outside a sewer service area will contribute to wastewater discharge for this analysis, with the permitted uses of each zone determining the property's designation as a residential, non-residential, or mixed-use development. Each future residential unit and associated individual subsurface sewage disposal system (ISSDS) is assumed to produce and treat an average of 300 gallons per day (GPD) of wastewater. To assess the wastewater discharge associated with anticipated future non-residential uses, the development potential was converted from square feet of nonresidential floor area into an equivalent number of residential uses (Equivalent Residential Units=[Non-Residential Floor Area x 0.125 gal/sq. ft./day]/500 Gal/Unit/Day). For zones considered to be mixed-use, a ratio of residential to non-residential development was used, as provided in the GIS data supplied by the SCPD for current local zoning. The SCPD also provided a GIS data layer of approved undeveloped projects to strengthen the accuracy and completeness of the analysis.

In accordance with the NJDEP WQMP Rules, the build-out analysis results for the non-sewer service areas are presented by municipality and HUC11 Watershed area or portion thereof. Property boundaries and roadways do not necessarily follow watershed boundaries; therefore, parcels were split along HUC11 lines for the purpose of this analysis in instances where a lot is traversed by a watershed line. Information from the Highlands Municipal Buildout Report specific to the portion of Bedminster Township located within the Highlands Preservation Area, which is presented at the HUC14 sub-watershed level, is incorporated

into this report consistent with the WQMP rules. Figure 19 provides a listing of the HUC11 watersheds that are within each municipality.

Figure 19: HUC11 Watersheds by Municipality

South Bound Brook Borough	2030105120	Raritan R Lower (Lawrence to Millstone)
Warren Township	2030105120	Raritan R Lower (Lawrence to Millstone)
Watchung Borough	2030105120	Raritan R Lower (Lawrence to Millstone)

While the analysis performed in this report is accurate and conservative to the extent possible, discharge projections of this scale have inherent variability. This discharge projection cannot consider any future amendments to municipal master plans, zoning ordinances and development plans or future public open

space acquisitions or farmland preservation activities. As such, the accuracy of this projection is directly dependent upon the degree to which the buildout model and associated GIS data layers reflect current land use plans, regulations and existing land use conditions. This projection did not consider the potential for site-specific use and bulk variances that would allow construction that is out of conformance with town/city ordinances, except where known.

Build-Out Analysis of Non-Sewer Service Areas

The build-out analysis was primarily based on SCPD's GIS potentially developable vacant land (PDVL) layer, to which the SCPD's municipal-specific GIS Zoning data layer was applied. It was assumed that all potential development will comply with the maximum density or maximum floor area allowed by zoning. In the case of residential development, any development potential resulting in a fraction of a residential unit was rounded down to the nearest unit. Lots that were in more than one zone district were split based on the zoning district boundaries and treated as separate lots for the purposes of this analysis. After splitting parcels traversed by zoning boundaries, each resulting lot was recalculated for potential developable acreage and square footage.

Potential Residential Development

Determining the development potential for residentially-zoned parcels begins by determining if the lot meets the minimum lot area requirement for the zone. If the lot meets the minimum lot area, the number of potential dwelling units permitted by the zone is calculated based on the maximum permitted density. Properties that yielded a fractional number of dwelling units were rounded down to the nearest whole number of units.

Contiguous Undersized Parcels

Contiguous undersized parcels in the same zone and the same HUC11 watershed were reevaluated to determine if building potential was possible if merged. If the merged lot meets the minimum lot area requirement, the number of dwelling units is calculated using the above method.

Potential Non-Residential Development

Parcels within non-residential zones that meet the minimum lot area requirement for the zone are considered developable. In order to assess the wastewater discharge associated with anticipated future non-residential uses, the development potential must be converted from non-residential floor area into an equivalent number of residential units. The following formula, provided by the NJDEP, was used: (Equivalent Residential Units=[Non-Residential Floor Area x 0.125 gal/sq. ft./day]/500 Gal/Unit/Day).

Undersized non-residential parcels were reevaluated to see if building potential was possible for those located adjacent to undersized lots in the same zone. If the merged lots then met the zone's minimum lot size requirement, square footage was calculated using the previously described methodology for non-residential development. Adjacent undersized parcels in different zones, as well as lots previously separated by watershed boundaries, were also left undeveloped. For this analysis, no parcels met this criterion for combined lots.

Mixed Use Development

Wastewater demands for mixed use development were calculated using both methods for residential and non-residential development, then calculating the ratio of residential to non-residential use for a given zone.

Approved Development

It was assumed that properties with site plan or subdivision approvals will be developed as per the development approvals rather than the current zoning, contributing to wastewater discharge based on either residential or non-residential use, as per the SCPD's Approved Undeveloped Projects GIS layer. Properties that were partially in a sewer service area were excluded, assuming the development will utilize existing sewer infrastructure to build.

Projected Increase in ISSDS

The anticipated number of equivalent residential dwelling units from the approved projects and the build-out are added together to establish the total additional wastewater demand of all non-sewer serviced areas (See Figure 20). It is noted that there are no PDVL properties outside of the sewer service areas within Manville Borough, Millstone, Raritan, Rocky Hill Borough, South Bound Brook Borough or Watchung Borough.

B. Nitrate Dilution Analysis Results in Non-Sewer Service Areas

Antidegradation Analysis of Non-Sewer Service Areas

In areas outside of sewer service areas, the default wastewater management alternative is individual subsurface sewage disposal system (“ISSDS”) which discharge to groundwater of 2,000 gallons per day or less, commonly referred to as septic systems. The assessment of water quality impacts from development on septic systems relies on nitrate concentration. In this analysis, nitrate acts as a conservative surrogate for any of a number of constituents that could be discharged from a septic system (e.g. cleaners, solvents, pharmaceuticals, etc.). Nitrate is chosen because it is highly soluble in water, and because it is a stable compound that by itself could render water unsuitable for human consumption. The capacity to support septic systems without violating groundwater quality standards is determined by the amount of dilution available.

The Water Quality Management Planning Rules advocate a watershed approach to assessing the adequacy of available dilution to meet future development on septic systems. Using this approach, available dilution, (essentially groundwater recharge), is calculated within a HUC11 watershed and translated into a finite amount of wastewater that can be discharged, which in turn can be translated into a finite number of housing units that can be supported while maintaining a target concentration of nitrate in groundwater. Zoning is then applied to the available land in that same watershed, outside of any sewer service area, to calculate the number of units that could be developed on septic systems. The results of these two analyses are then compared and if the number of units based on zoning does not exceed the maximum units that can be supported, adequate capacity has been demonstrated.

This Nitrate Dilution Analysis is prepared for municipalities that contain non-sewer service area to determine the target/allowable number of ISSDS based on the Nitrate Dilution Standard in N.J.A.C. 7:15-4.5(c)1. The analysis will determine the amount of land contributing to nitrate dilution and groundwater recharge, which will be used to determine the target number of ISSDS based on the HUC11-specific average septic density required to meet the NJDEP’s 2 mg/L target nitrate concentration anti-degradation policy (for areas outside of the Highlands Preservation Area) and the maximum number of new septic systems that can be supported in each HUC11. The result represents the total number of ISSDS that could be developed at full build-out within non-sewer service areas in each municipality without substantially degrading the water quality within the HUC11 watersheds. The target number of ISSDS is equal to the total acreage of all parcels with groundwater recharge potential (undeveloped and underdeveloped parcels and permanently preserved lands) within each HUC11 watershed divided by the pre-calculated potential septic density (average acre/system) as provided by NJDEP for each HUC11 watershed.

This analysis used NJDEP’s nitrate-nitrogen target of 2 mg/L, with the assumption that all ammonium and other nitrogen compounds are converted to nitrate within the property, and that the nitrate concentrations dilute evenly across the HUC11 watershed. These assumptions are implicit in the nitrate dilution model developed by NJDEP.

The WQMP Rule does not mandate uniformly zoning minimum lot sizes at the calculated densities across the watershed. Rather, this comparable residential zoning density represents the total number of units that, if built, would not result in a degradation of groundwater quality within a given watershed by exceeding the 2 mg/L nitrate limit.

In accordance with N.J.A.C. 7:15-4.5(c)1.ii, the Nitrate Dilution Analysis must determine the number of undeveloped and underdeveloped acres within each municipality or portion thereof in each HUC11. For the purposes of this analysis, the undeveloped and underdeveloped lands will include the PDVL layer plus preserved open space and farmland parcels. The sum of the undeveloped and underdeveloped acres is then divided by the NJDEP pre-determined septic density for each HUC11 watershed to calculate the target/allowable number of ISSDS systems (see Figure 21).

In accordance with the NJDEP Water Quality Management Plan (WQMP) rules, the septic area build-out is segregated by the HUC11 Watershed boundaries within each municipality. Property boundaries and roadways do not necessarily follow watershed boundaries; therefore, parcels were split into separate sub-parcels for this analysis in instances where a lot is traversed by a HUC11 boundary line.

Figure 21: Total Target ISSDS by Municipality and HUC11

Totals

Figure 22 illustrates the comparison of potential new ISSDS to the target ISSDS in each municipality by watershed management area. The “Potential New ISSDS” column represents the equivalent number of ISSDS required to serve the potential future development of areas outside of the County’s sewer service areas based on current zoning. This analysis concludes that there is only one HUC11 watershed that would exceed the nitrate dilution standard at future building, which is the Passaic River Upr (above Pine Bk br) within Bernards Township. All other HUC11 watersheds will meet the 2.0 mg/L nitrate dilution standard at full buildout.

Highlands Preservation Area

Lands within the Highlands Preservation Area are required to comply with the nitrate dilution standards based on the HUC14 subwatershed in accordance with Highlands Water Protection and Planning Act rules at N.J.A.C. 7:38-3.4(b). Based upon the Bedminster Township Municipal Build-out Report (“MBOR”)³ prepared in January 2010 by the Highlands Council, three (3) septic systems would be considered permissible under the NJDEP Preservation Area Rules at N.J.A.C. 7:38-3.4. The Highlands MBOR assessed each vacant or over-sized lot identified through Module 1 and 2 to determine whether it was of sufficient size to accommodate one or more septic systems, based on NJDEP requirements for 1 unit per 25 acres of non-forested lands, 1 unit per 88 acres of forested lands, or some proportional combination thereof.

IV. APPENDIX

Proposed/Planned Residential Development within Urbanized Municipalities

Although future flows associated with proposed/planned residential development and redevelopment projects were excluded from the urbanized wastewater flow calculations pursuant to N.J.A.C. 7:15-4.5(b)1.ii(1) (including those associated with TWA projects in Figure 6), the SCPD recognizes that current and future growth in these municipalities, in which significant revitalization efforts are underway, may exceed historical growth trends. In addition, many municipalities in Somerset County and across New Jersey are engaged in the Mount Laurel IV Declaratory Judgement Process which is being implemented by the Courts. Most participating municipalities in Somerset County have finalized settlement agreements with the Fair Share Housing Center and Amended Housing Elements and Fair Share Plans which have been deemed compliant with the State Fair Housing Act and Rules which define municipal affordable housing obligations and how these obligations will be met by including site-specific information regarding the numbers of units that will be constructed. Depending upon the build-out timeline for proposed/planned residential projects in these municipalities, which is influenced by housing market and economic conditions, financial policies and other factors, the projected growth for 2040 based on the NJTPA projections may be underestimated. For this analysis, anticipated wastewater flows based on known proposed/planned residential development and redevelopment projects were not incorporated into the total wastewater GPD of non-urbanized municipalities because it is based on projected population. In order to support future planning of wastewater treatment capacity improvements, potential future wastewater flows associated with known proposed/planned residential projects in adopted redevelopment areas and adopted municipal housing elements and fair share plans within these urbanized municipalities is provided herein using information compiled by the SCPD; together with future flows associated with the residential components of the TWA projects presented in Figure 6 for general planning purposes. The total potential future GPD associated with known planned/proposed residential development in these communities is 253,732 GPD, of which 160,837 would be addressed by SRVSA and 92,895 would be addressed by MCUA.

Methodology Report

FOR
Somerset County Wastewater Management Plan:
Wastewater Treatment Facility
Buildout and Capacity Analysis
Somerset County, New Jersey

February 3, 2020

Prepared For
Somerset County Planning Division
Somerset County Administration Building
20 Grove Street, P.O. Box 3000
Somerville, NJ 08876

Prepared By
Maser Consulting P.A.
Shelbourne at Hunterdon
53 Frontage Rd, Suite 110
Hampton, NJ 08827

This report sets forth the methodology and assumptions to be utilized in preparing the wastewater and septic capacity analysis for the Somerset County Planning Division (SCPD). This methodology was discussed with and accepted by NJDEP staff on January 28, 2020.

WMP components for the balance of the County, including but not limited to the Wastewater Treatment Plant Capacity Analyses, will be substantially consistent with the Montgomery Township-Rocky Hill Borough WMP Component adopted November 4, 2019 as previously agreed to be the County Planning Division and NJDEP BEARS.

20 Year Projection of Future WWTF Flows – Urbanized Municipalities (in accordance with N.J.A.C 7:15-4.5(b)1ii(1))

For the three urbanized municipalities (Bound Brook Borough, North Plainfield Borough and Somerville Borough), Maser Consulting will prepare future wastewater flow projections within a 20-year planning horizon from the date of WMP preparation, pursuant to N.J.A.C. 7:15-4.5(b)(ii)(1). Maser Consulting will utilize available population projections from the North Jersey Transportation Planning Authority (NJTPA). It will be based on the assumption that the entirety of the three urbanized municipalities will be built out in this timeframe. Future new population based on the population projections will be converted to wastewater flows using NJDEP standard wastewater multipliers (i.e. 75 gallons per capita per day).

In addition, N.J.A.C. 7:15-4.5(b)(ii)(1) provides that flows from sources such as expanded or redeveloped commercial and industrial sites can be taken into account. Somerset County has compiled information on planned/proposed future development and redevelopment and projects with treatment works approvals (TWAs), which will be taken into account in the future flow projections. Flows from existing development not currently connected to public sewers (i.e. development that is currently served by individual subsurface sewage disposal systems (ISSDS)) will also be taken into account to avoid underestimating future flows since the NJTPA projection do not make this distinction. Information about future flows associated with known proposed/planned residential construction and redevelopment projects that will result in population growth that will exceed NJTPA’s projections will be noted in the appendix.

Build-out of Future WWTF Flows Within Assigned SSA– Non-Urban Municipalities (in accordance with N.J.A.C 7:15-4.5(b)1.ii(1))

For the non-urbanized municipalities, Maser Consulting will estimate build-out future wastewater flows from existing development that is not currently connected to public sewers (i.e. development that is currently served by individual subsurface sewage disposal systems (ISSDS)). The analysis will also take into account future development based on zoning and flow projections applied to undeveloped and underdeveloped parcels. Flows from approved undeveloped projects including those for which TWAs have been issued; undeveloped projects identified in court-approved Mount

Laurel IV settlement agreements; housing elements and fair share plans and associated development agreements; and adopted redevelopment areas will also be addressed.

Methodology and Assumptions

- It is assumed that existing development serviced by ISSDS within the future sewer service area (SSA) will connect to the assigned SSA of the respective wastewater treatment facility. The properties with existing residential development served by ISSDS have already been identified in GIS format by the SCPD. A wastewater flow multiplier of 300 gpd per ISSDS unit will be applied.
- It is assumed that all future development of properties within each assigned sewer service area will contribute to wastewater flows for the purpose of this analysis.
- The permitted use(s) of each zone dictates whether each undeveloped/underdeveloped property is assigned as residential, non-residential (commercial) or mixed-use development.
- Where a zone permits more than one type of non-residential development (i.e. office or industrial), the analysis assumes the development type that would yield the highest wastewater demand. The ratio of residential to non-residential development as provided in the SCPD GIS Zoning layer will be applied to undeveloped/underdeveloped parcels within zones that permit mixed-use development.,.
- The analysis will be based on the Potentially Developable Vacant Land layer prepared by the SCPD developed using the NJDEP's GIS Model Builder Tool and updated on an on-going basis. Maximum development yield will be calculated based on either gross or net acreage, depending upon which definition of density is utilized by each municipality, as specified in each municipal-specific zoning ordinance. Undeveloped/underdeveloped Properties not meeting the minimum required lot area will be excluded. Contiguous undersized developable lands on adjoining properties in the same zone district may be assumed to be combined to meet the minimum lot area.
- It is assumed that undeveloped/underdeveloped properties with local subdivision and site plan approvals and/or TWA approvals according to the TWA Project List provided by NJDEP will be developed as per the development approvals rather than the current zoning. The approved development will contribute to wastewater flows based on the number of approved residential units and amount of non-residential square footage.
- The analysis will incorporate future flows associated with planned affordable housing projects and adopted redevelopment areas using the contributing source GIS datasets provided by the SCPD for this purpose.
- This analysis is meant to analyze the zoning regulations adopted by the municipality to determine whether the resulting development can be accommodated based on current WWTF capacity. It is assumed that all commercial development will comply with the maximum

density or maximum floor area allowed by zoning. No variance relief is assumed by this analysis. Therefore, development potential resulting in a fraction of a residential unit is rounded down to the nearest unit.

- It is assumed that each new residential unit will produce an average wastewater flow of 300 GPD in accordance with NJDEP projected flow standards for residential dwellings with three or more bedrooms, except for residential approved undeveloped projects that have TWAs for which wastewater flows will be determined based on N.J.A.C. 7:14A-23.
- Future nonresidential development is assumed to produce 0.100 GPD/sq. ft., in accordance with the NJDEP projected flows for both office and retail development in accordance with N.J.A.C. 7:14A-23.
- Existing wastewater flows will be calculated as the highest consecutive 12 months rolling average over the most recent five-year period preceding development of the WMP, as reported in the Discharge Monitoring Reports required pursuant to N.J.A.C. 7:14A-6.8 for the facility.
- Future wastewater flows within assigned sewer service areas from both urban and non-urban municipalities will be tallied to the WWTF-Assigned Sewer Service Area level and added to existing flows by WWTF, then compared with current permitted flow for each WWTF located in Somerset County to determine if there is a potential capacity deficiency in accordance with 7:15-4.5 (b)3.

Build-out of Septic Systems – Non-Sewer Service Areas/ Nitrate Dilution Analysis – Non- Sewer Service Areas (pursuant to N.J.A.C. 7:15-4.5(c)1)

All non-sewer service areas (areas outside of the adopted WWTF assigned sewer service areas) are assumed to be serviced by on-site ISSDS. Maser Consulting will prepare a build-out based septic density analysis of developable parcels within the non-sewer service areas of each municipality. This analysis will estimate the target/allowable number of ISSDS that can be accommodated in undeveloped and underdeveloped non-sewer service areas that will result in attainment of 2 mg/L nitrate in the groundwater on a HUC11 basis. The target number of ISSDS will then be compared with a calculation of the potential number of ISSDS that could result based on current zoning.

Methodology and Assumptions:

- Maser Consulting will prepare a nitrate dilution analysis for municipalities that contain non-sewer service area to determine the target/allowable number of ISSDS based on the Nitrate Dilution Standard in N.J.A.C. 7:15-4.5(c)1. This analysis will determine the amount of land contributing to nitrate dilution and groundwater recharge, which will be used to determine the target number of ISSDS based on the HUC11-specific average septic density required to meet

the NJDEP's 2 mg/L target nitrate concentration anti-degradation policy (for areas outside of the Highlands Preservation Area) and the maximum number of new septic systems that can be supported in each HUC11. This result represents the total number of ISSDS that could be developed at full build-out within non-sewer service areas in each municipality without substantially degrading the water quality within the HUC11 watersheds. The target number of ISSDS is equal to the total acreage of all parcels with groundwater recharge potential (undeveloped and underdeveloped parcels and permanently preserved lands) within each HUC11 watershed divided by the pre-calculated potential septic density (average acre/system) as provided by NJDEP for each HUC11 watershed.

- In accordance with N.J.A.C. 7:15-4.5(c)1.ii, the analysis must determine the number of undeveloped and underdeveloped acres within each municipality or portion thereof in each HUC11. For the purposes of this analysis, the undeveloped and underdeveloped lands will include the PDVL layer plus preserved open space and farmland parcels. Since the Nitrate Dilution Model assigns 0 ground water recharge for wetlands/hydric soils, there is no need to remove environmental constraints from the analysis. The sum of the undeveloped and underdeveloped acres will then be divided by the NJDEP determined septic density for each HUC11 watershed to calculate the target/allowable number of ISSDS systems.
- Maser Consulting will determine the number of potential ISSDS associated with future development based on current zoning for municipalities that contain non-sewer service area. The permitted use(s) of each zone dictate whether each undeveloped/underdeveloped property is assigned as residential, non-residential (commercial) or mixed-use development type.
- The wastewater flow from future commercial development in non-sewer service areas will be calculated in accordance with 7:15-4.5(c)1.iii. The following formula is provided by the NJDEP for this calculation: Equivalent Residential Units = [Non-Residential Floor Area x 0.125 gal/sq. ft./day] / 500 Gal/ Unit/ Day.
- In accordance with the NJDEP WQMP Rules, the non-sewer service area build-out results will be presented at the HUC11 Watershed level within each municipality. Parcels within more than one HUC11 Watershed will be split based on the percentage of land within each HUC11 Watershed.
- Lands within the Highlands Preservation Area will reference (or will utilize) the Highlands Municipal Buildout Report based on the HUC14 subwatershed areas.
- The target/allowable number of ISSDS by HUC 11 for each municipality will be compared with the number of ISSDS by HUC 11 based on current zoning to determine if the future nitrate dilution capacity is sufficient to meet the projected loading from future development based on zoning.

Appendix B – Parcel and Site-specific Future Wastewater Flows for Non-urban Municipalities by WWTF Assigned SSA Spreadsheet

MEMORANDUM

To: Laurette Kratina, PP, AICP

From: Daniel Bloch, PP, AICP

Date: January 21, 2020

**Re: Somerset County Wastewater Management Plan
Buildout Methodology
MC Project No. 19000414G**

This memorandum sets forth the methodology and assumptions to be utilized in preparing the wastewater and septic capacity analysis for the Somerset County Planning Division (SCPD). It has been revised based on guidance provided by NJDEP staff. NJDEP's acceptance is needed in order for work on the analysis to proceed in a cost-effective and timely manner. Written acceptance from NJDEP is therefore hereby requested as soon as possible.

WMP components for the balance of the County, including but not limited to the Wastewater Treatment Plant Capacity Analyses, will be substantially consistent with the Montgomery Township-Rocky Hill Borough WMP Component adopted November 4, 2019 as previously agreed to be the County Planning Division and NJDEP BEARS.

20 Year Projection of Future WWTF Flows – Urbanized Municipalities (In accordance with N.J.A.C 7:15-4.5(b)1ii(1))

For the three urbanized municipalities (Bound Brook Borough, North Plainfield Borough and Somerville Borough), Maser Consulting will prepare future wastewater flow projections within a 20-year planning horizon from the date of WMP preparation, pursuant to N.J.A.C. 7:15-4.5(b)(ii)(1). Maser Consulting will utilize available population projections from the North Jersey Transportation Planning Authority (NJTPA). It will be based on the assumption that the entirety of the three urbanized municipalities will be built out in this timeframe. Future new population based on the population projections will be converted to wastewater flows using NJDEP standard wastewater multipliers (i.e. 75 gallons per capita per day).

In addition, N.J.A.C. 7:15-4.5(b)(ii)(1) provides that flows from sources such as expanded or redeveloped commercial and industrial sites can be taken into account. Somerset County has compiled information on planned/proposed future development and redevelopment and projects with treatment works approvals (TWAs), which will be taken into account in the future flow projections. Flows from existing development not currently connected to public sewers (i.e.

development that is currently served by individual subsurface sewage disposal systems (ISSDS)) will also be taken into account to avoid underestimating future flows since the NJTPA projection do not make this distinction. Information about future flows associated with known proposed/planned residential construction and redevelopment projects that will result in population growth that will exceed NJTPA's projections will be noted in the appendix.

Build-out of Future WWTF Flows Within Assigned SSA– Non-Urban Municipalities (In accordance with N.J.A.C 7:15-4.5(b)1.ii(1))

For the non-urbanized municipalities, Maser Consulting will estimate build-out future wastewater flows from existing development that is not currently connected to public sewers (i.e. development that is currently served by individual subsurface sewage disposal systems (ISSDS)). The analysis will also take into account future development based on zoning and flow projections applied to undeveloped and underdeveloped parcels. Flows from approved undeveloped projects including those for which TWAs have been issued; undeveloped projects identified in court-approved Mount Laurel IV settlement agreements; housing elements and fair share plans and associated development agreements; and adopted redevelopment areas will also be addressed.

Methodology and Assumptions

- It is assumed that existing development serviced by ISSDS within the future sewer service area (SSA) will connect to the assigned SSA of the respective wastewater treatment facility. The properties with existing residential development served by ISSDS have already been identified in GIS format by the SCPD. A wastewater flow multiplier of 300 gpd per ISSDS unit will be applied.
- It is assumed that all future development of properties within each assigned sewer service area will contribute to wastewater flows for the purpose of this analysis.
- The permitted use(s) of each zone dictates whether each undeveloped/underdeveloped property is assigned as residential, non-residential (commercial) or mixed-use development.
- Where a zone permits more than one type of non-residential development (i.e. office or industrial), the analysis assumes the development type that would yield the highest wastewater demand. The ratio of residential to non-residential development as provided in the SCPD GIS Zoning layer will be applied to undeveloped/underdeveloped parcels within zones that permit mixed-use development..
- The analysis will be based on the Potentially Developable Vacant Land layer prepared by the SCPD developed using the NJDEP's GIS Model Builder Tool and updated on an on-going basis. Maximum development yield will be calculated based on either gross or net acreage, depending upon which definition of density is utilized by each municipality, as specified in

each municipal-specific zoning ordinance. Undeveloped/underdeveloped Properties not meeting the minimum required lot area will be excluded. Contiguous undersized developable lands on adjoining properties in the same zone district may be assumed to be combined to meet the minimum lot area.

- It is assumed that undeveloped/underdeveloped properties with local subdivision and site plan approvals and/or TWA approvals according to the TWA Project List provided by NJDEP will be developed as per the development approvals rather than the current zoning. The approved development will contribute to wastewater flows based on the number of approved residential units and amount of non-residential square footage.
- The analysis will incorporate future flows associated with planned affordable housing projects and adopted redevelopment areas using the contributing source GIS datasets provided by the SCPD for this purpose.
- This analysis is meant to analyze the zoning regulations adopted by the municipality to determine whether the resulting development can be accommodated based on current WWTF capacity. It is assumed that all commercial development will comply with the maximum density or maximum floor area allowed by zoning. No variance relief is assumed by this analysis. Therefore, development potential resulting in a fraction of a residential unit is rounded down to the nearest unit.
- It is assumed that each new residential unit will produce an average wastewater flow of 300 GPD in accordance with NJDEP projected flow standards for residential dwellings with three or more bedrooms, except for residential approved undeveloped projects that have TWAs for which wastewater flows will be determined based on N.J.A.C. 7:14A-23.
- Future nonresidential development is assumed to produce 0.100 GPD/sq. ft., in accordance with the NJDEP projected flows for both office and retail development in accordance with N.J.A.C. 7:14A-23.
- Existing wastewater flows will be calculated as the highest consecutive 12 months rolling average over the most recent five-year period preceding development of the WMP, as reported in the Discharge Monitoring Reports required pursuant to N.J.A.C. 7:14A-6.8 for the facility.
- Future wastewater flows within assigned sewer service areas from both urban and non-urban municipalities will be tallied to the WWTF-Assigned Sewer Service Area level and added to existing flows by WWTF, then compared with current permitted flow for each WWTF located in Somerset County to determine if there is a potential capacity deficiency in accordance with 7:15-4.5 (b)3.

Build-out of Septic Systems – Non-Sewer Service Areas/ Nitrate Dilution Analysis – Non-Sewer Service Areas pursuant to N.J.A.C. 7:15-4.5(c)1

All non-sewer service areas (areas outside of the adopted WWTF assigned sewer service areas) are assumed to be serviced by on-site ISSDS. Maser Consulting will prepare a build-out based septic density analysis of developable parcels within the non-sewer service areas of each municipality. This analysis will estimate the target/allowable number of ISSDS that can be accommodated in undeveloped and underdeveloped non-sewer service areas that will result in attainment of 2 mg/L nitrate in the groundwater on a HUC11 basis. The target number of ISSDS will then be compared with a calculation of the potential number of ISSDS that could result based on current zoning.

Methodology and Assumptions:

- Maser Consulting will prepare a nitrate dilution analysis for municipalities that contain non-sewer service area to determine the target/allowable number of ISSDS based on the Nitrate Dilution Standard in N.J.A.C. 7:15-4.5(c)1. This analysis will determine the amount of land contributing to nitrate dilution and groundwater recharge, which will be used to determine the target number of ISSDS based on the HUC11-specific average septic density required to meet the NJDEP's 2 mg/L target nitrate concentration anti-degradation policy (for areas outside of the Highlands Preservation Area) and the maximum number of new septic systems that can be supported in each HUC11. This result represents the total number of ISSDS that could be developed at full build-out within non-sewer service areas in each municipality without substantially degrading the water quality within the HUC11 watersheds. The target number of ISSDS is equal to the total acreage of all parcels with groundwater recharge potential (undeveloped and underdeveloped parcels and permanently preserved lands) within each HUC11 watershed divided by the pre-calculated potential septic density (average acre/system) as provided by NJDEP for each HUC11 watershed.
- In accordance with N.J.A.C. 7:15-4.5(c)1.ii, the analysis must determine the number of undeveloped and underdeveloped acres within each municipality or portion thereof in each HUC11. For the purposes of this analysis, the undeveloped and underdeveloped lands will include the PDVL layer plus preserved open space and farmland parcels. Since the Nitrate Dilution Model assigns 0 ground water recharge for wetlands/hydric soils, there is no need to remove environmental constraints from the analysis. The sum of the undeveloped and underdeveloped acres will then be divided by the NJDEP determined septic density for each HUC11 watershed to calculate the target/allowable number of ISSDS systems.
- Maser Consulting will determine the number of potential ISSDS associated with future development based on current zoning for municipalities that contain non-sewer service area. The permitted use(s) of each zone dictate whether each undeveloped/underdeveloped property is assigned as residential, non-residential (commercial) or mixed-use development type.

- The wastewater flow from future commercial development in non-sewer service areas will be calculated in accordance with 7:15-4.5(c)1.iii. The following formula is provided by the NJDEP for this calculation: Equivalent Residential Units = [Non-Residential Floor Area x 0.125 gal/sq. ft./day] / 500 Gal/ Unit/ Day.
- In accordance with the NJDEP WQMP Rules, the non-sewer service area build-out results will be presented at the HUC11 Watershed level within each municipality. In order to avoid splitting parcels into small slivers of land which may fall below the required minimum lot area as per the zoning, Maser Consulting proposes to prepare a modified HUC11 planning boundary, which would follow lot lines and street centerlines when possible, not straying more than 500 feet from the HUC11 lines delineated by the NJDEP. Larger tracts of land may be split into separate subzones according to the HUC11 line. (This methodology was approved by the NJDEP as part of the Cape May County WMP prepared by Maser Consulting. At this point in time, Maser Consulting has already completed this work since there were no comments to this issue in the initial methodology report. NJDEP shall advise as to whether the results will be acceptable with this modified HUC11 planning boundary or if the analysis must utilize the unmodified NJDEP HUC11 boundaries.)
- Lands within the Highlands Preservation Area will reference (or will utilize) the Highlands Municipal Buildout Report based on the HUC14 subwatershed areas.
- The target/allowable number of ISSDS by HUC 11 for each municipality will be compared with the number of ISSDS by HUC 11 based on current zoning to determine if the future nitrate dilution capacity is sufficient to meet the projected loading from future development based on zoning.
