

# COVID-19 AND HIV: 1 Moment -2 Epidemics

The term “unprecedented” may have been exhausted during the COVID-19 pandemic, but it described perfectly how the pandemic has influenced the livelihood and states of mind of the world’s population.

For so many, never before has the disease been so little understood and so greatly feared. For others, the impact of COVID-19 may feel familiar, especially for those impacted by the HIV/AIDS epidemic.

In this workshop, we will explore the differences and similarities among both unprecedented events, and the psychological impact they have had on societies across the globe.
