

SPOTTED LANTERNFLY

SPOTTED LANTERNFLY

STOMP OUT THE LANTERNFLY!

Have you spotted one lately? The Spotted Lanternfly (*Lycorma delicatula*) known for their pinkish/tan wings adorned with spots, was first discovered on US soil in 2014. Now found in each county in New Jersey, including Somerset, it likes to feed on over 70 plant species like the Red Maple and grapevines.

While this insect is not harmful to humans or animals, they can greatly reduce quality of life by impacting agricultural crops and habitat.
